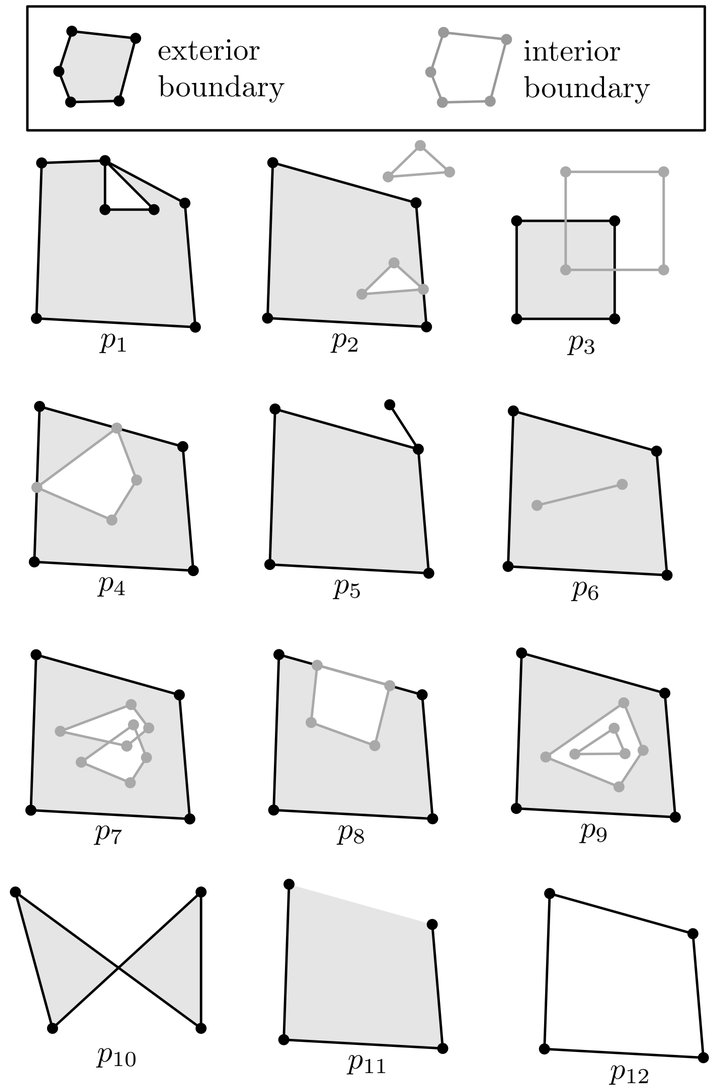
Delft University of Technology

Rules for validation in 2D

OGC Simple Features and ISO19107 rules:

1. no self-intersection
2. closed boundaries
3. rings can touch but not overlap
4. no duplicate points
5. no dangling edges
6. connected interior
7. etc



In 3D it's way more complex...

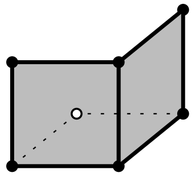
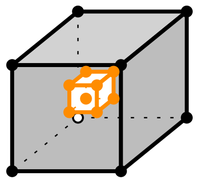
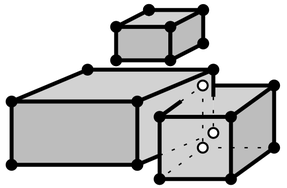
`MultiSurface`



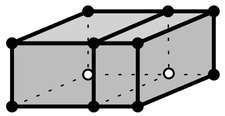
`CompositeSurface`



`Solid`



`MultiSolid`

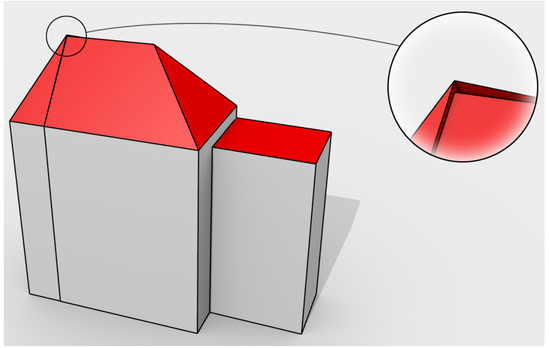


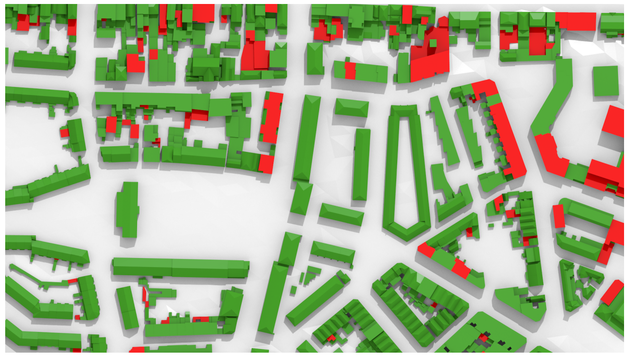
`CompositeSolid`

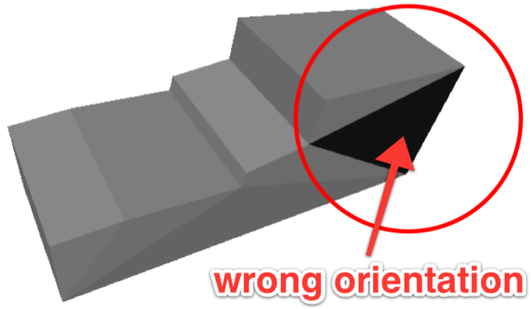
Do current 3D city models often contain these geometric errors?

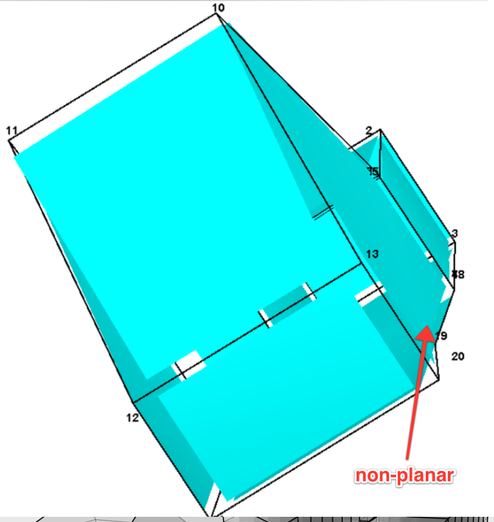
tl;dl: **YES.**

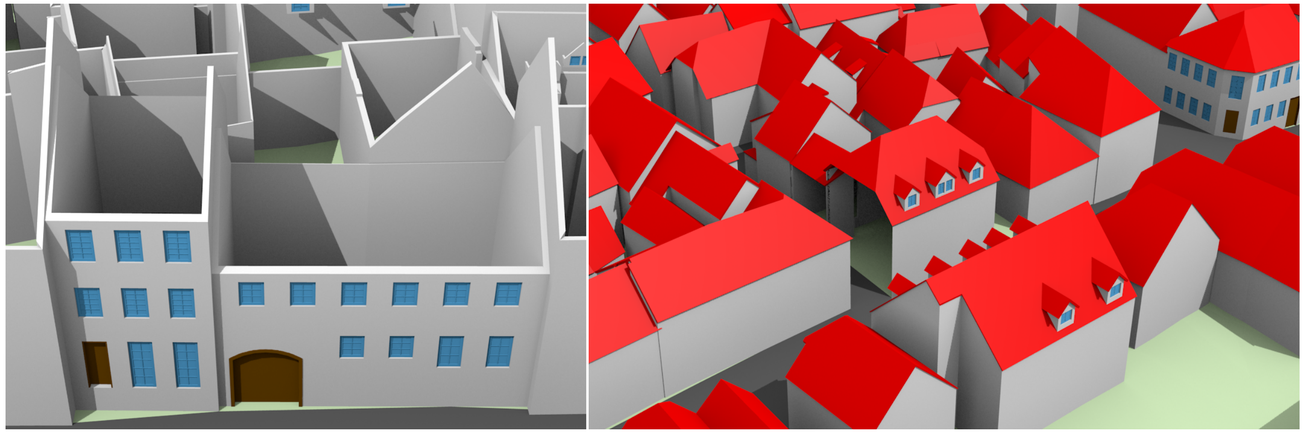
Errors are *very* common in 3D models: the wall of shame

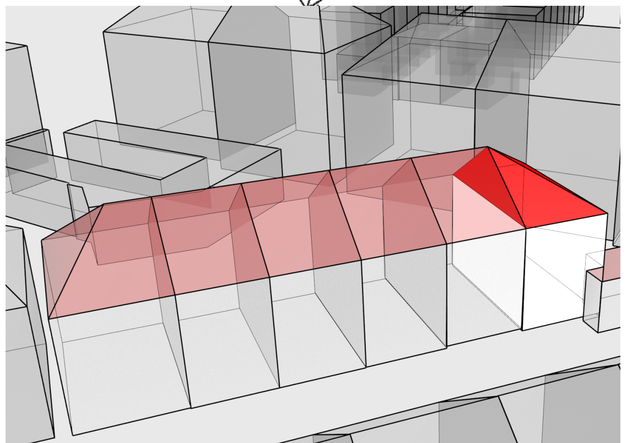


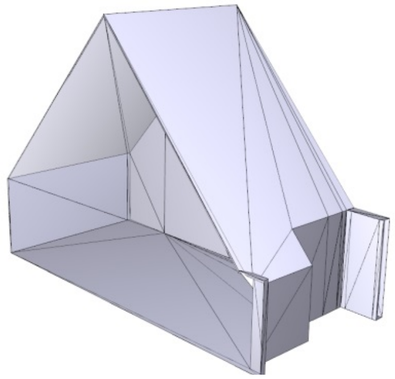


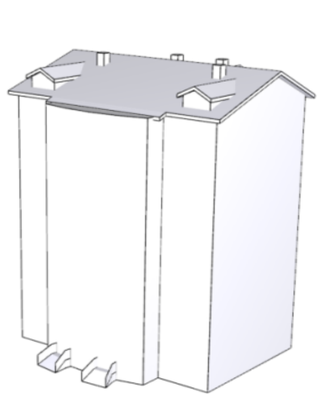


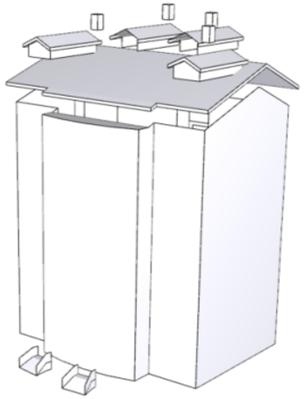










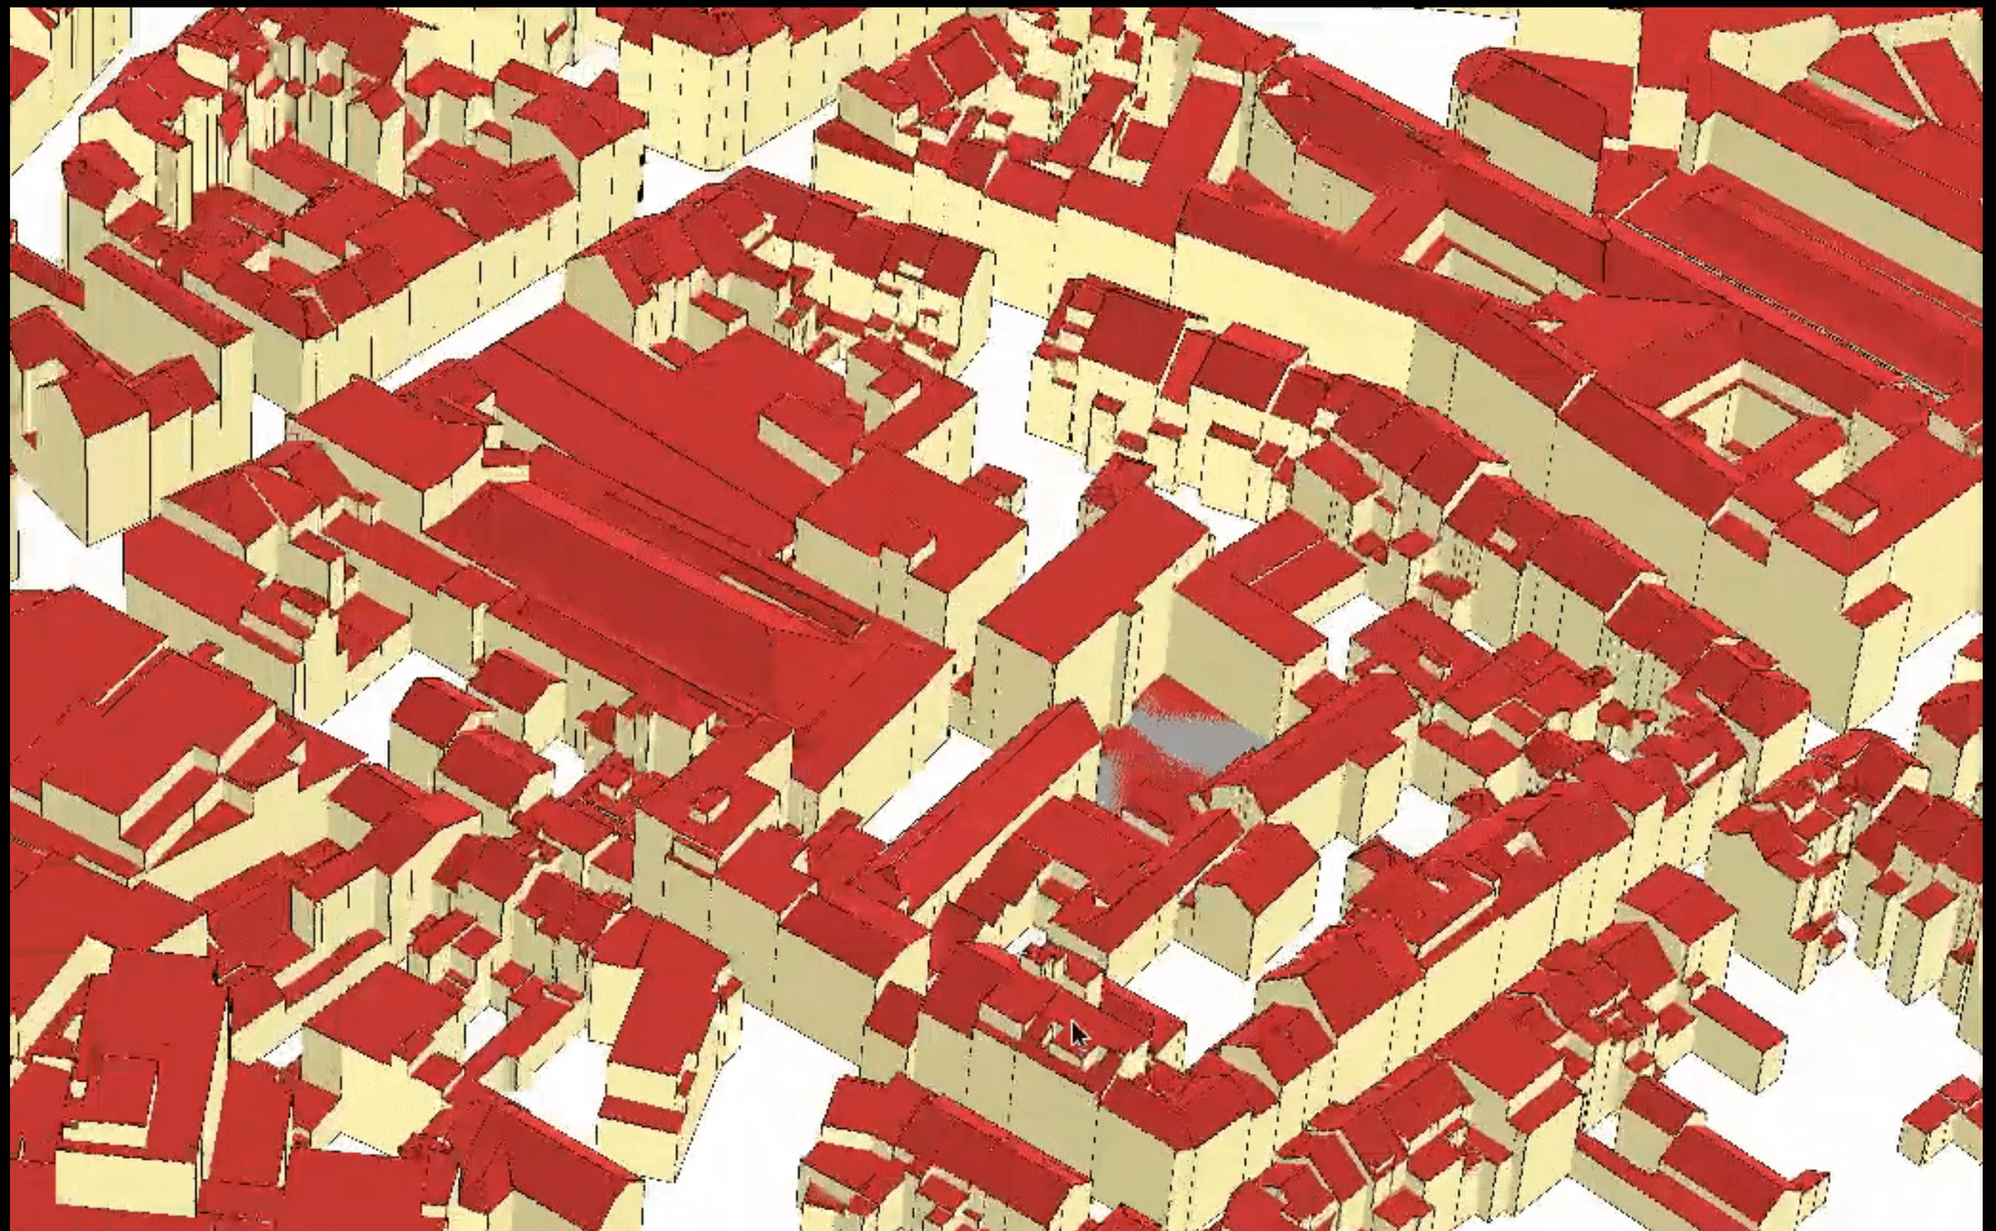


Should we care?

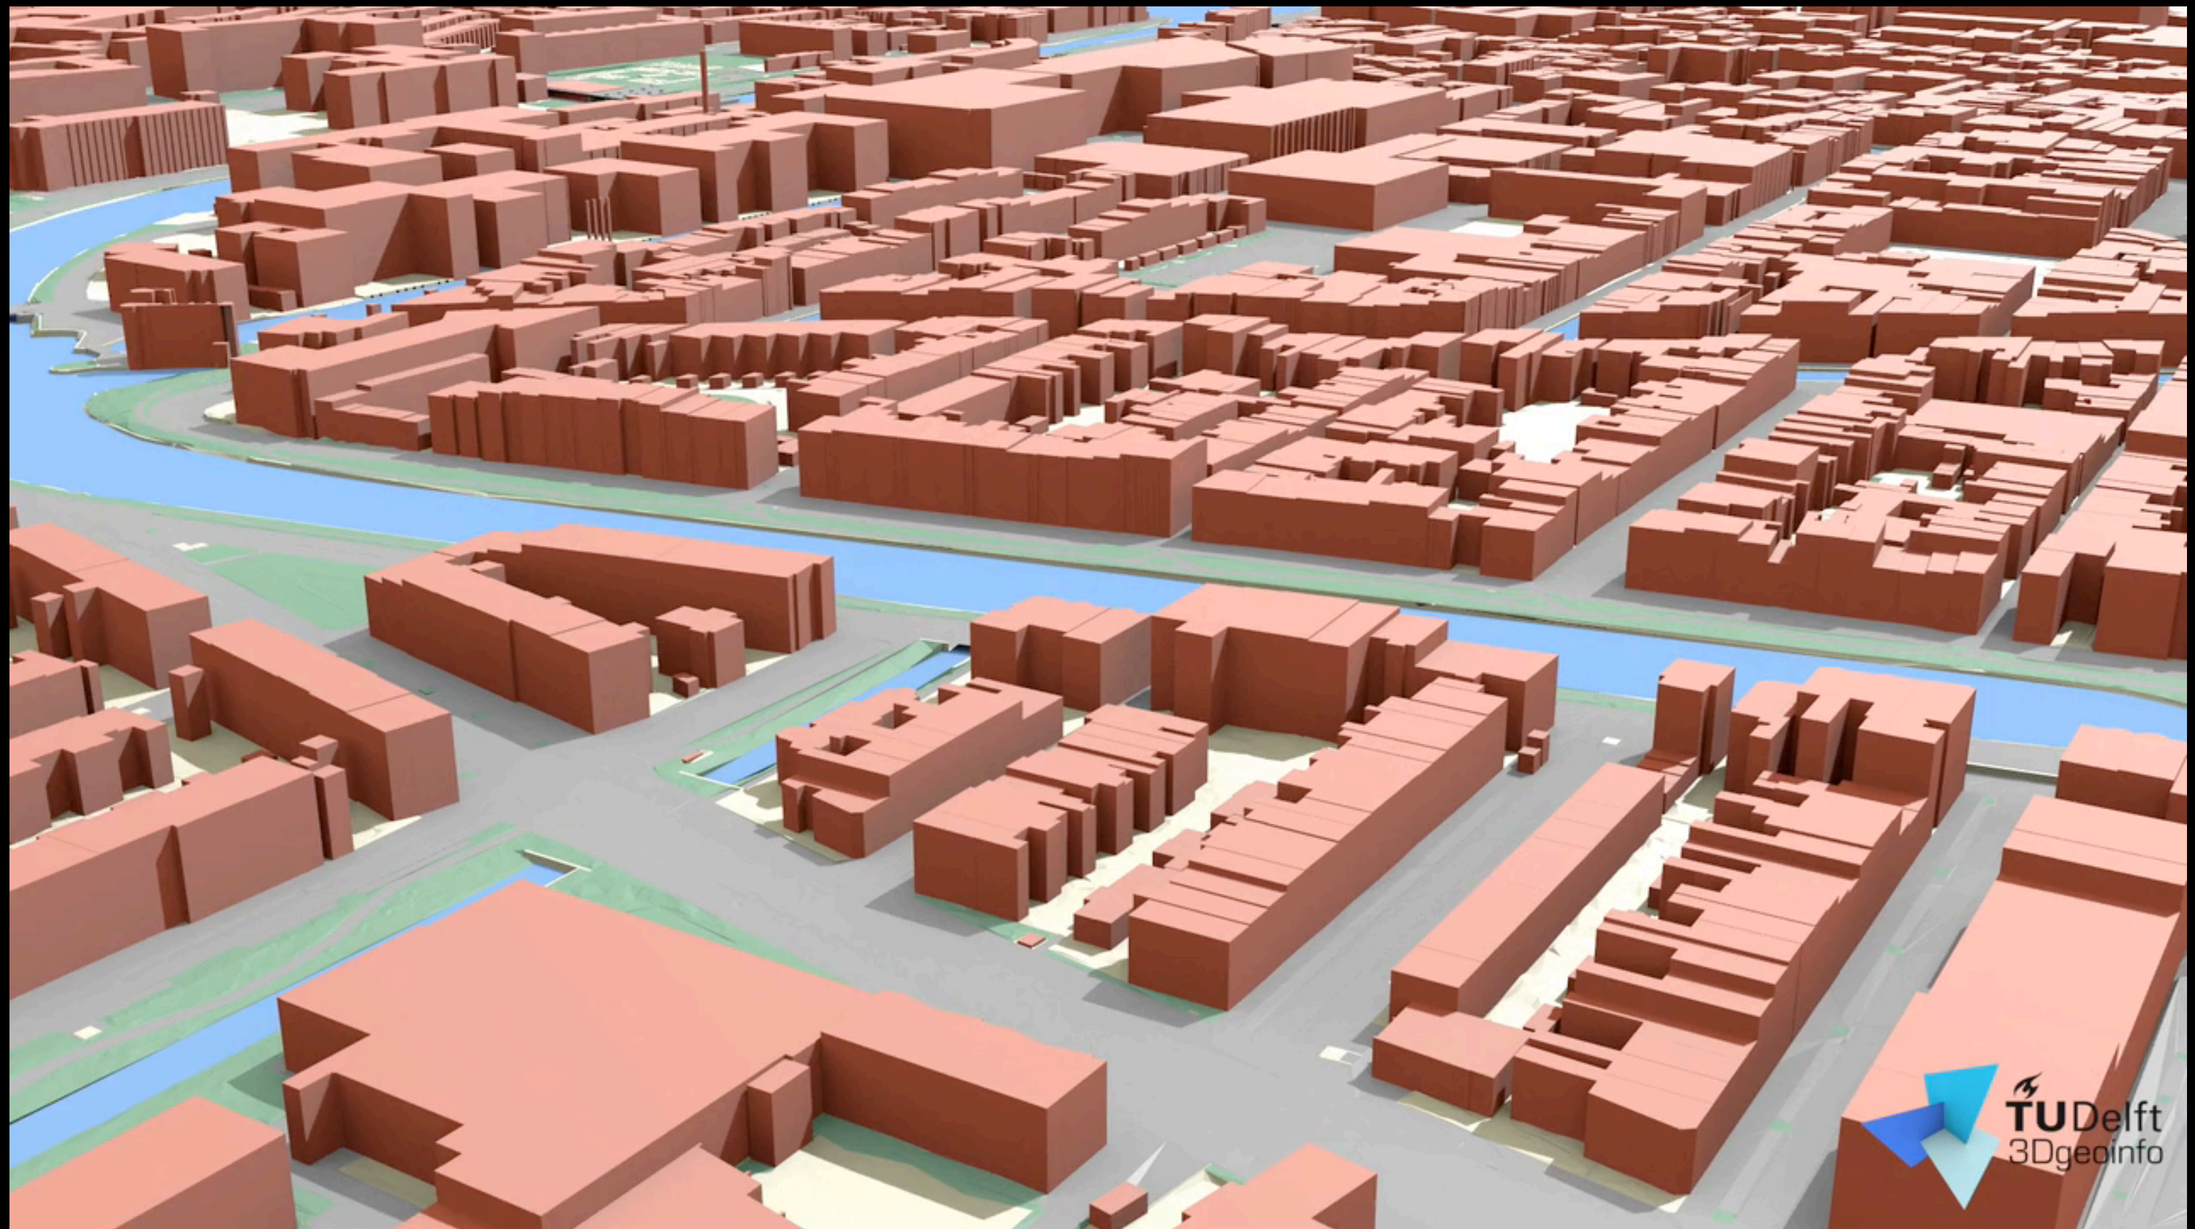
YES!

(especially if you want to pass this course 😅)

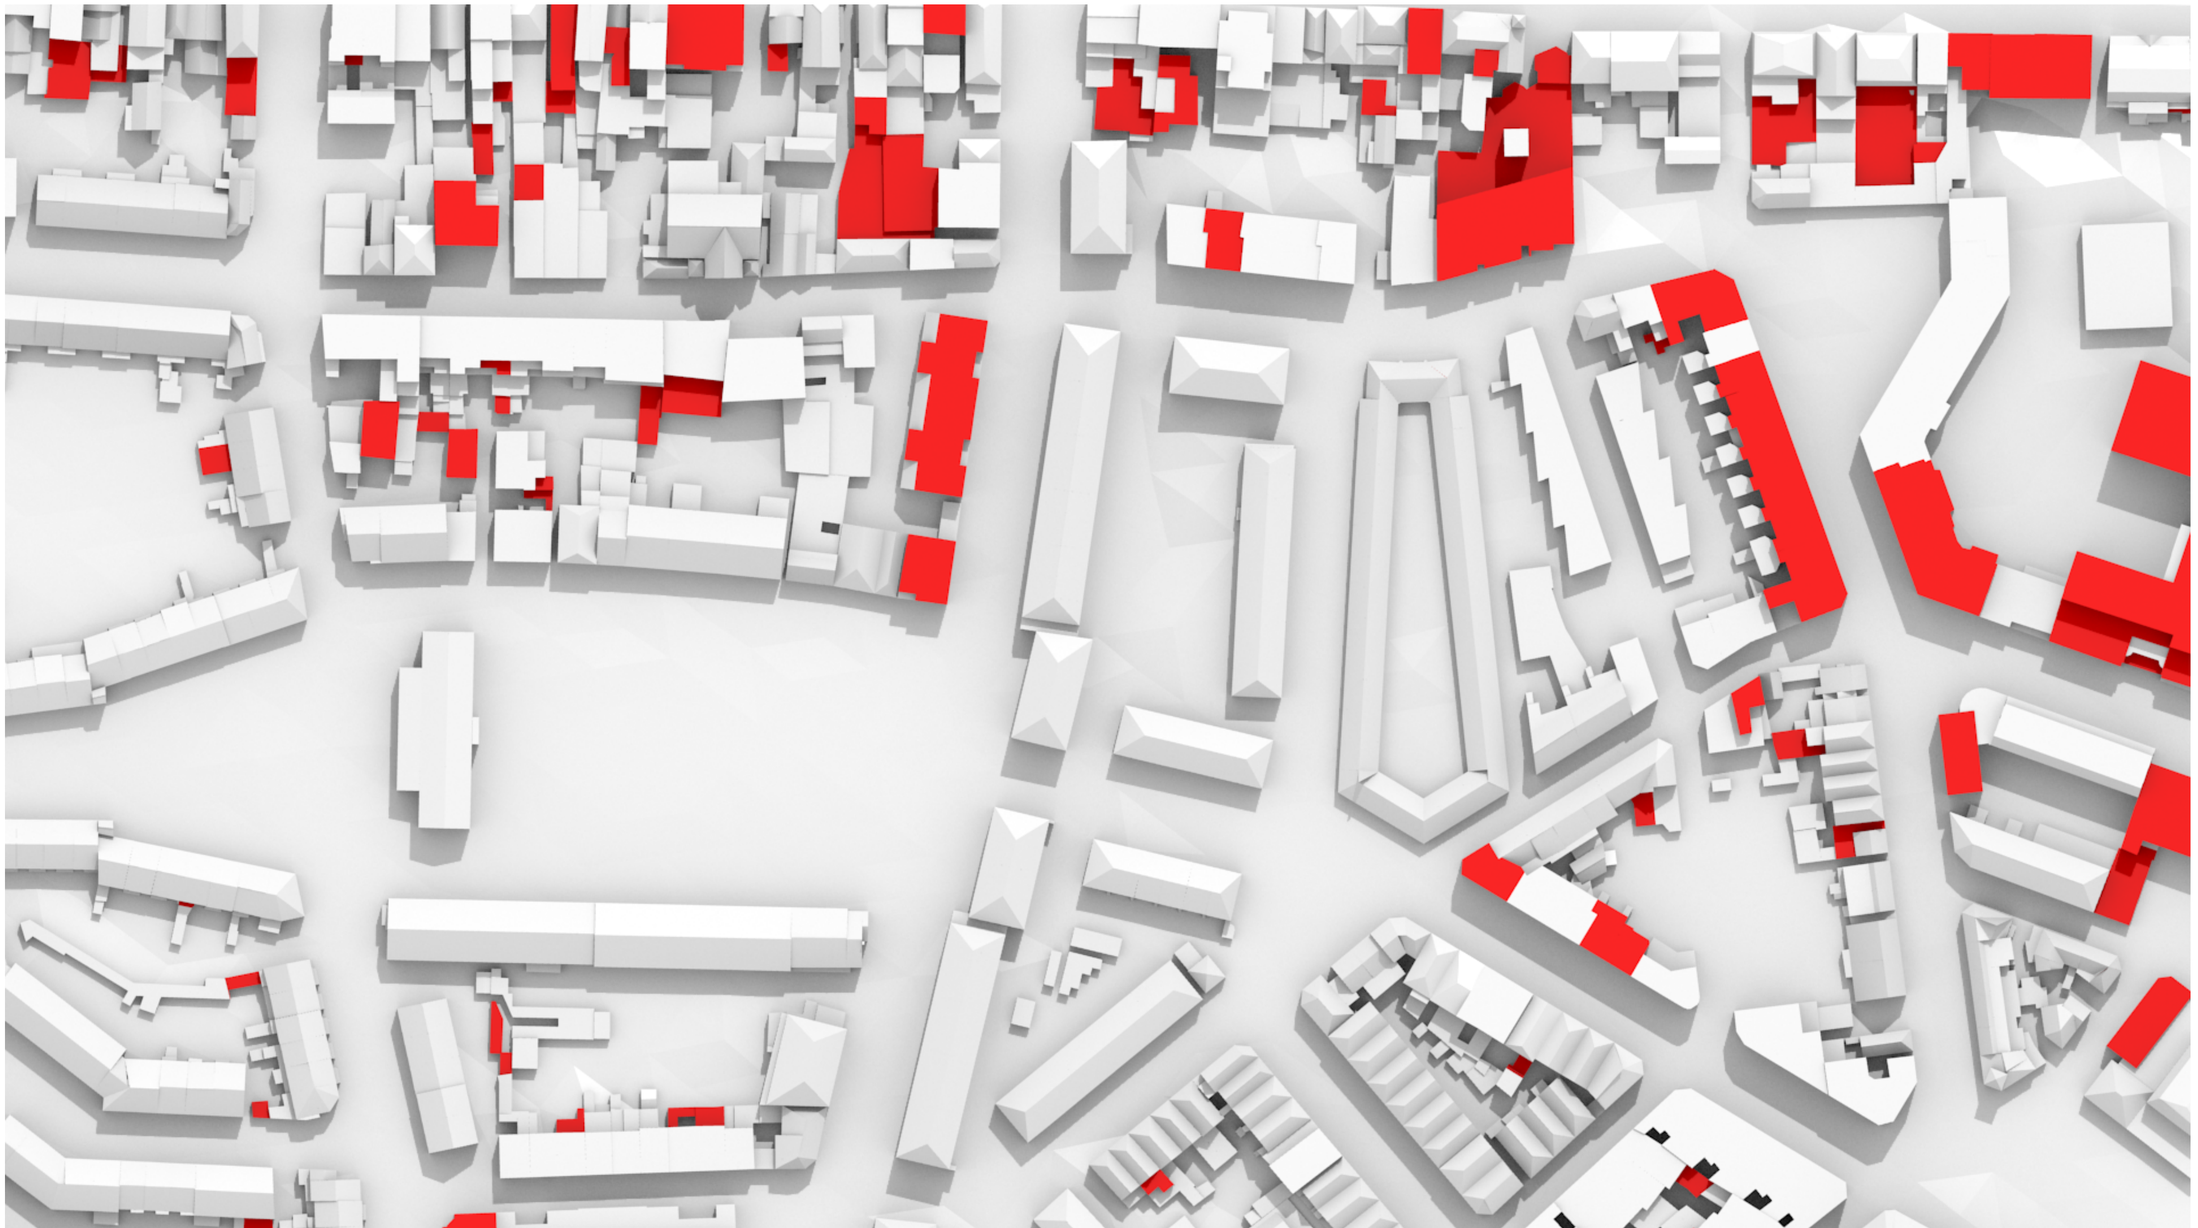
Visualisation — duplicated surfaces == annoying



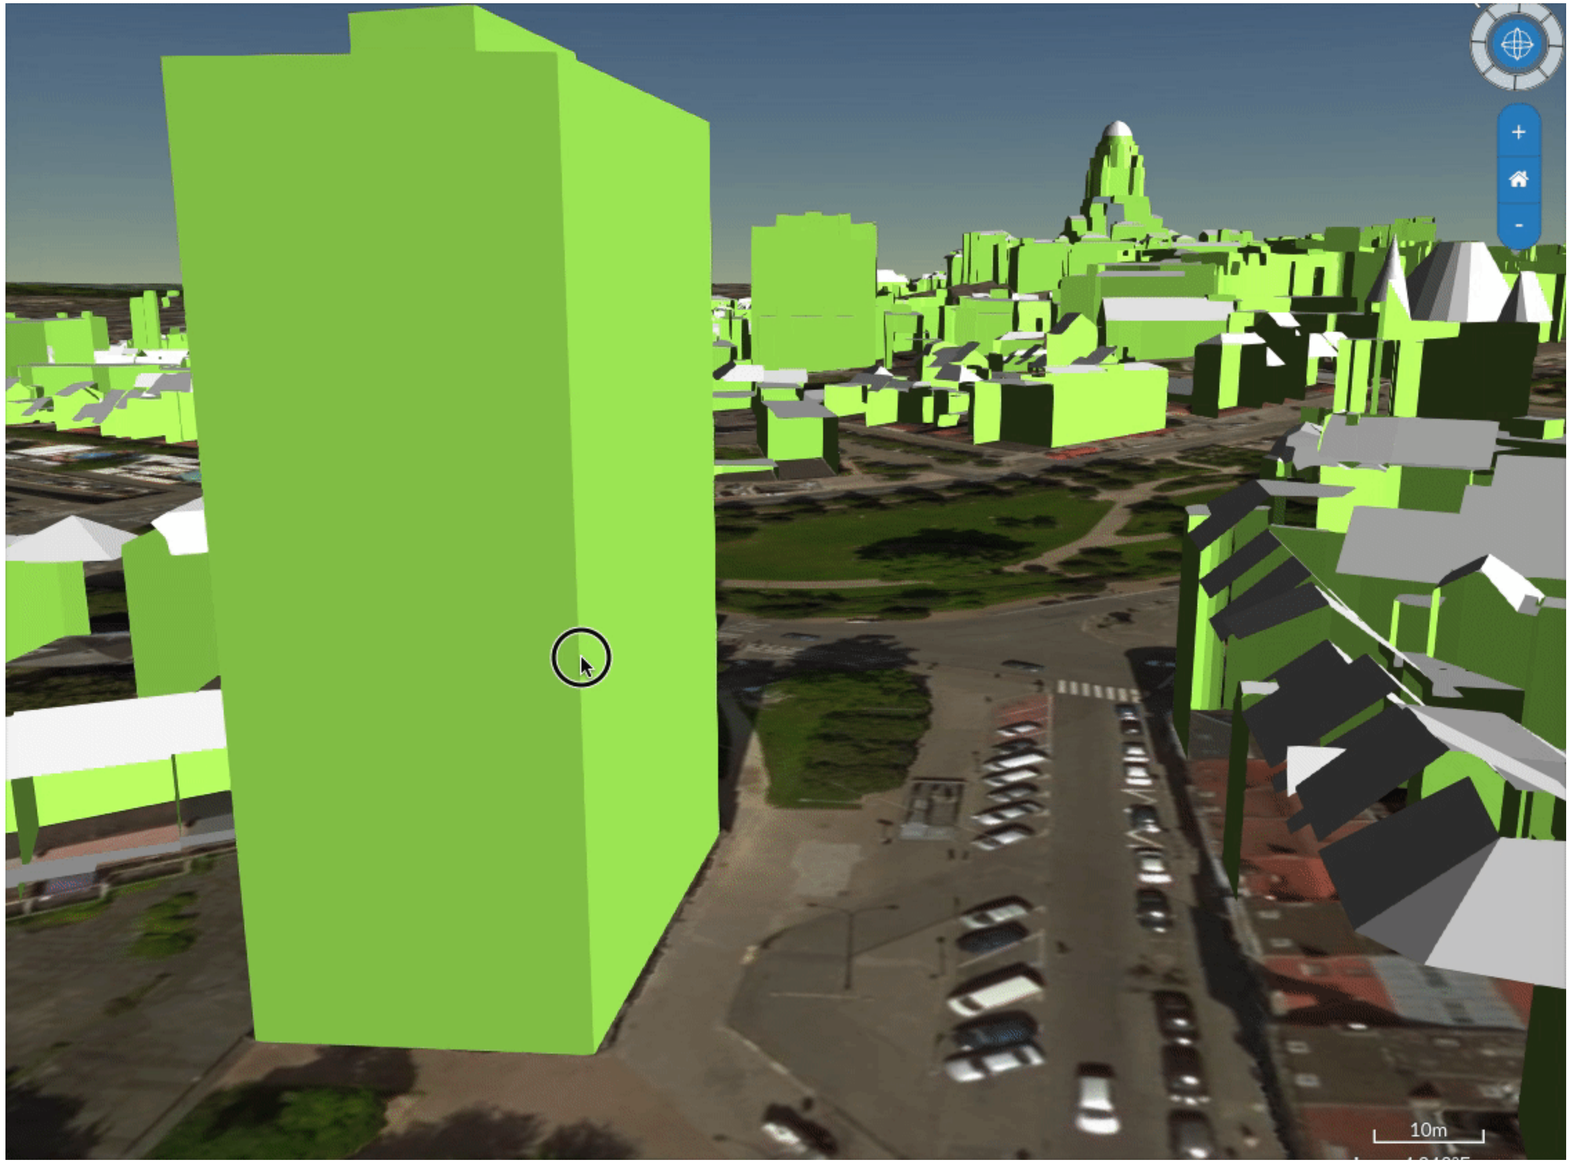
Visualisation — duplicated surfaces == distracting



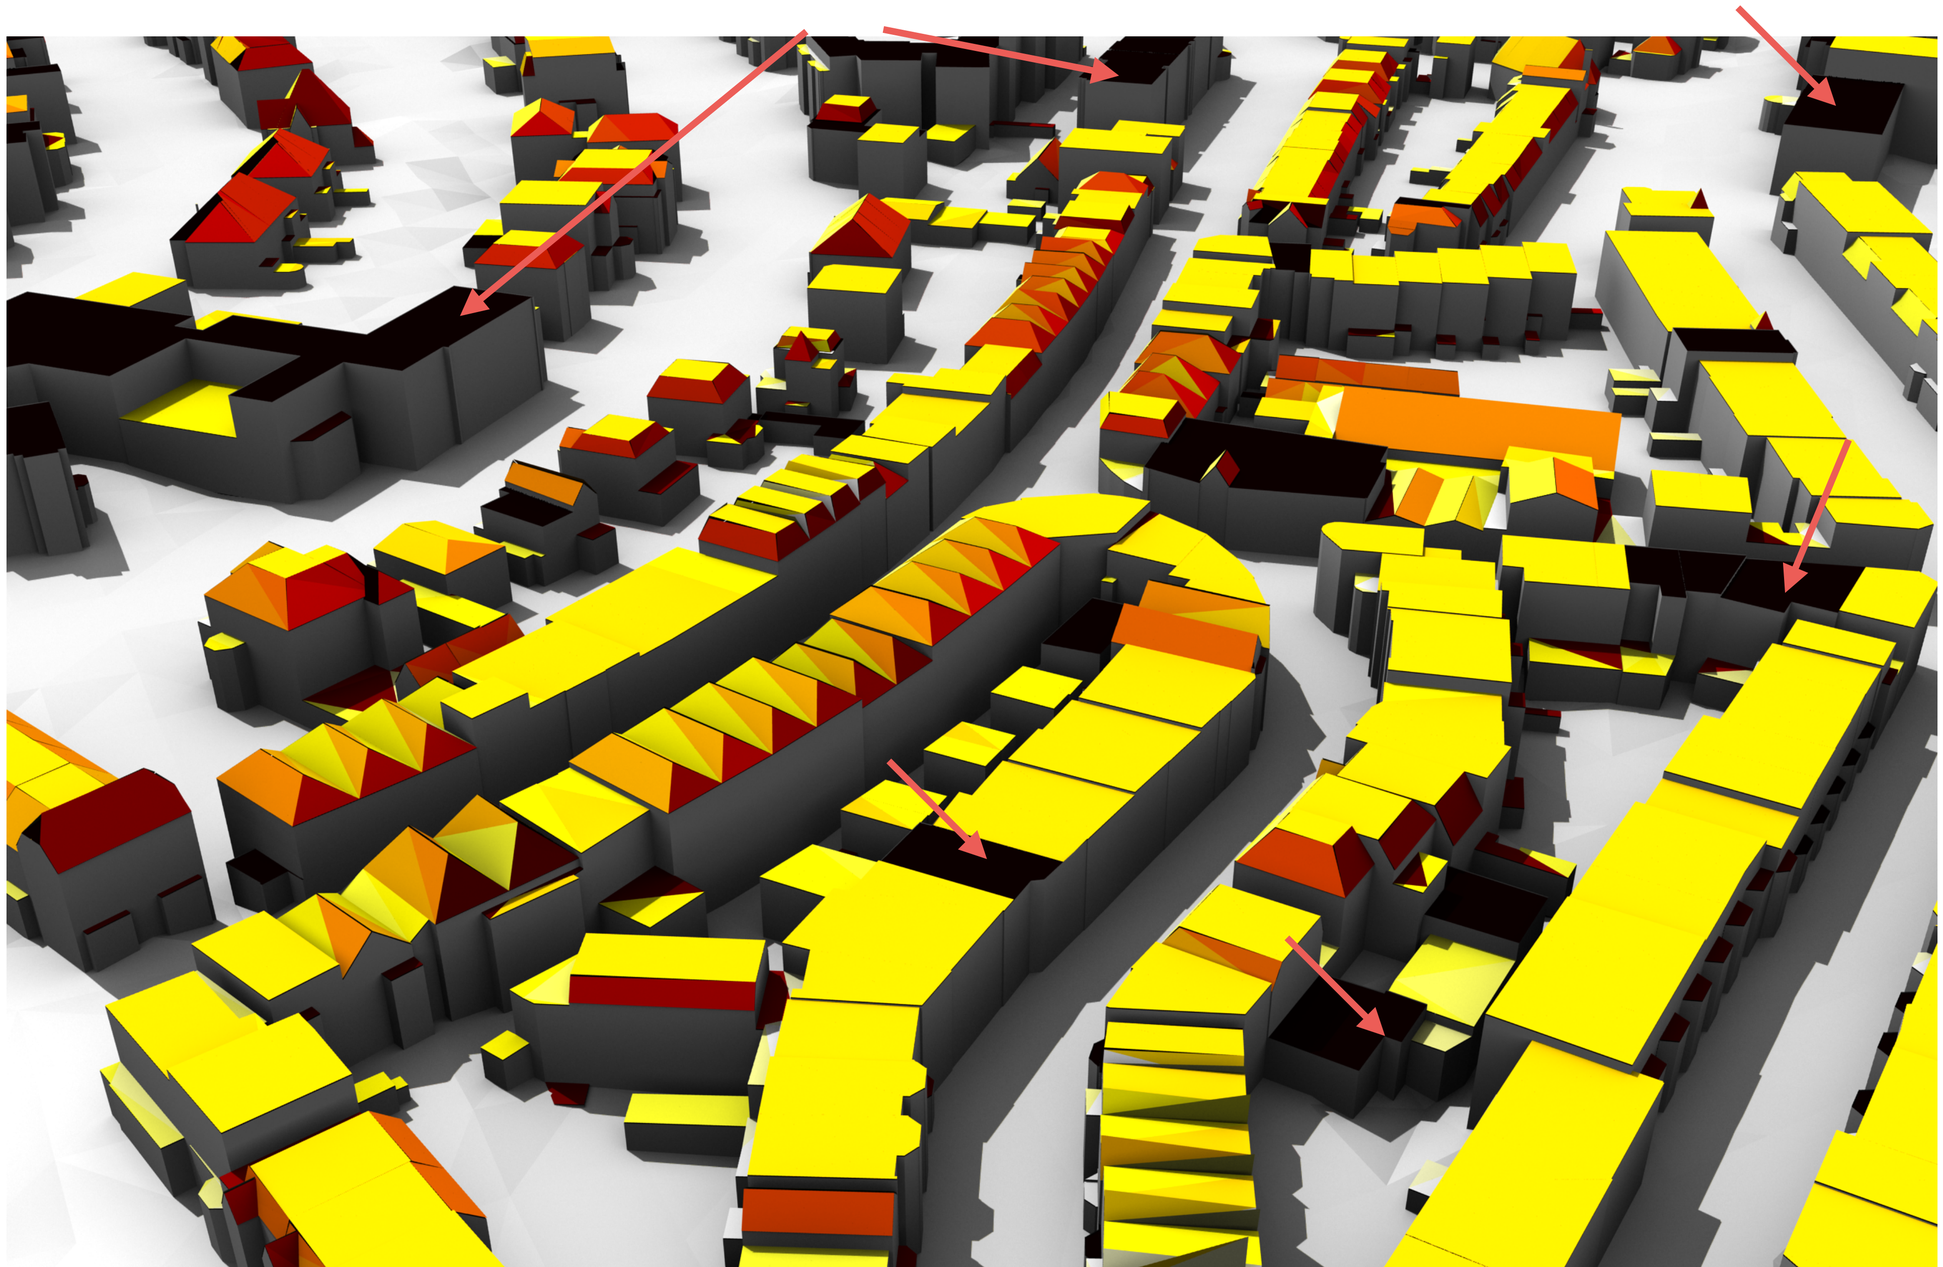
Visualisation – wrong orientation of surfaces (red ones)



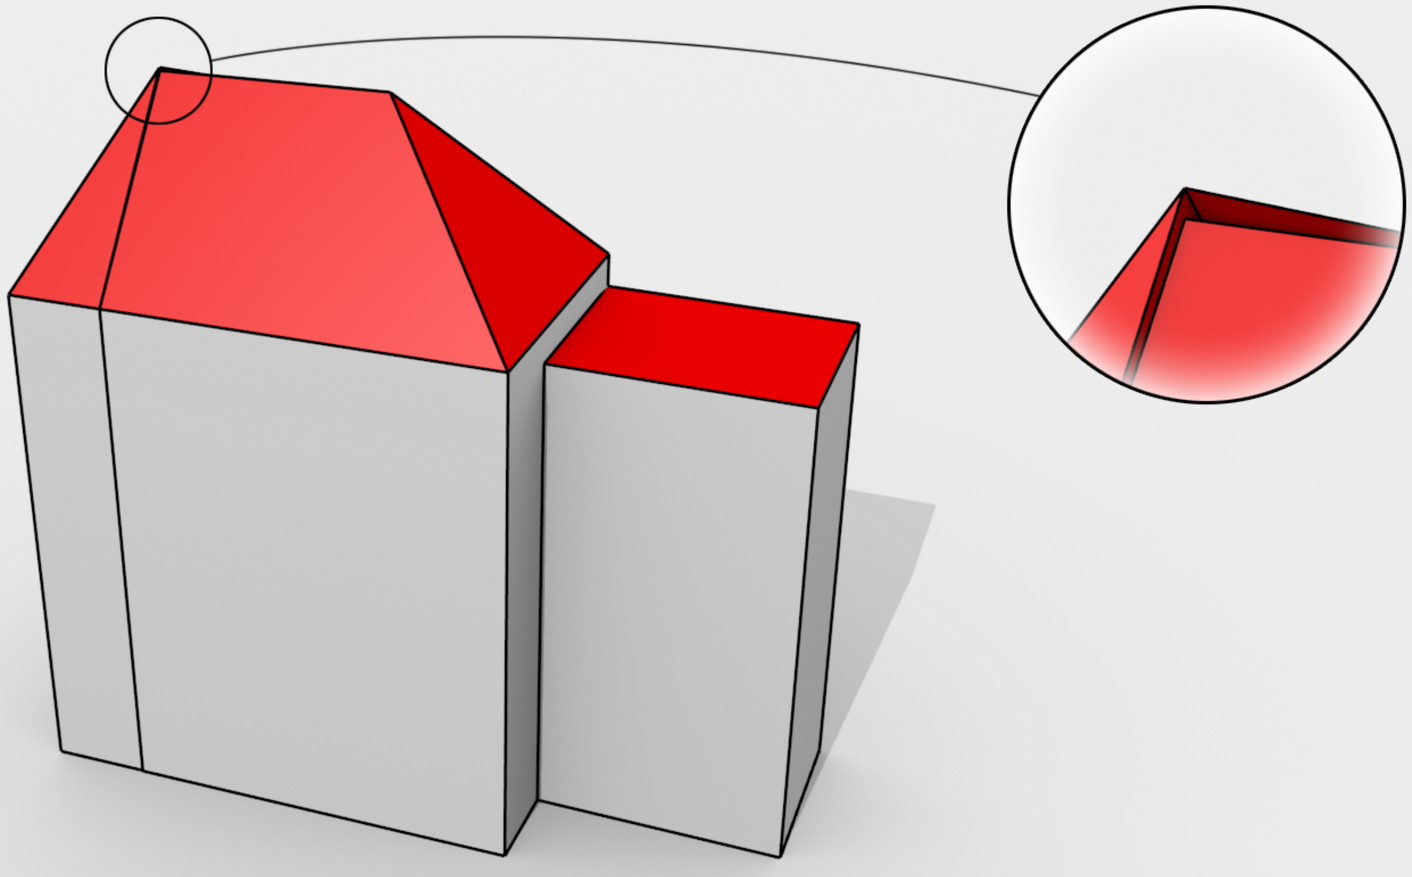
Visualisation — wrong orientation == missing faces



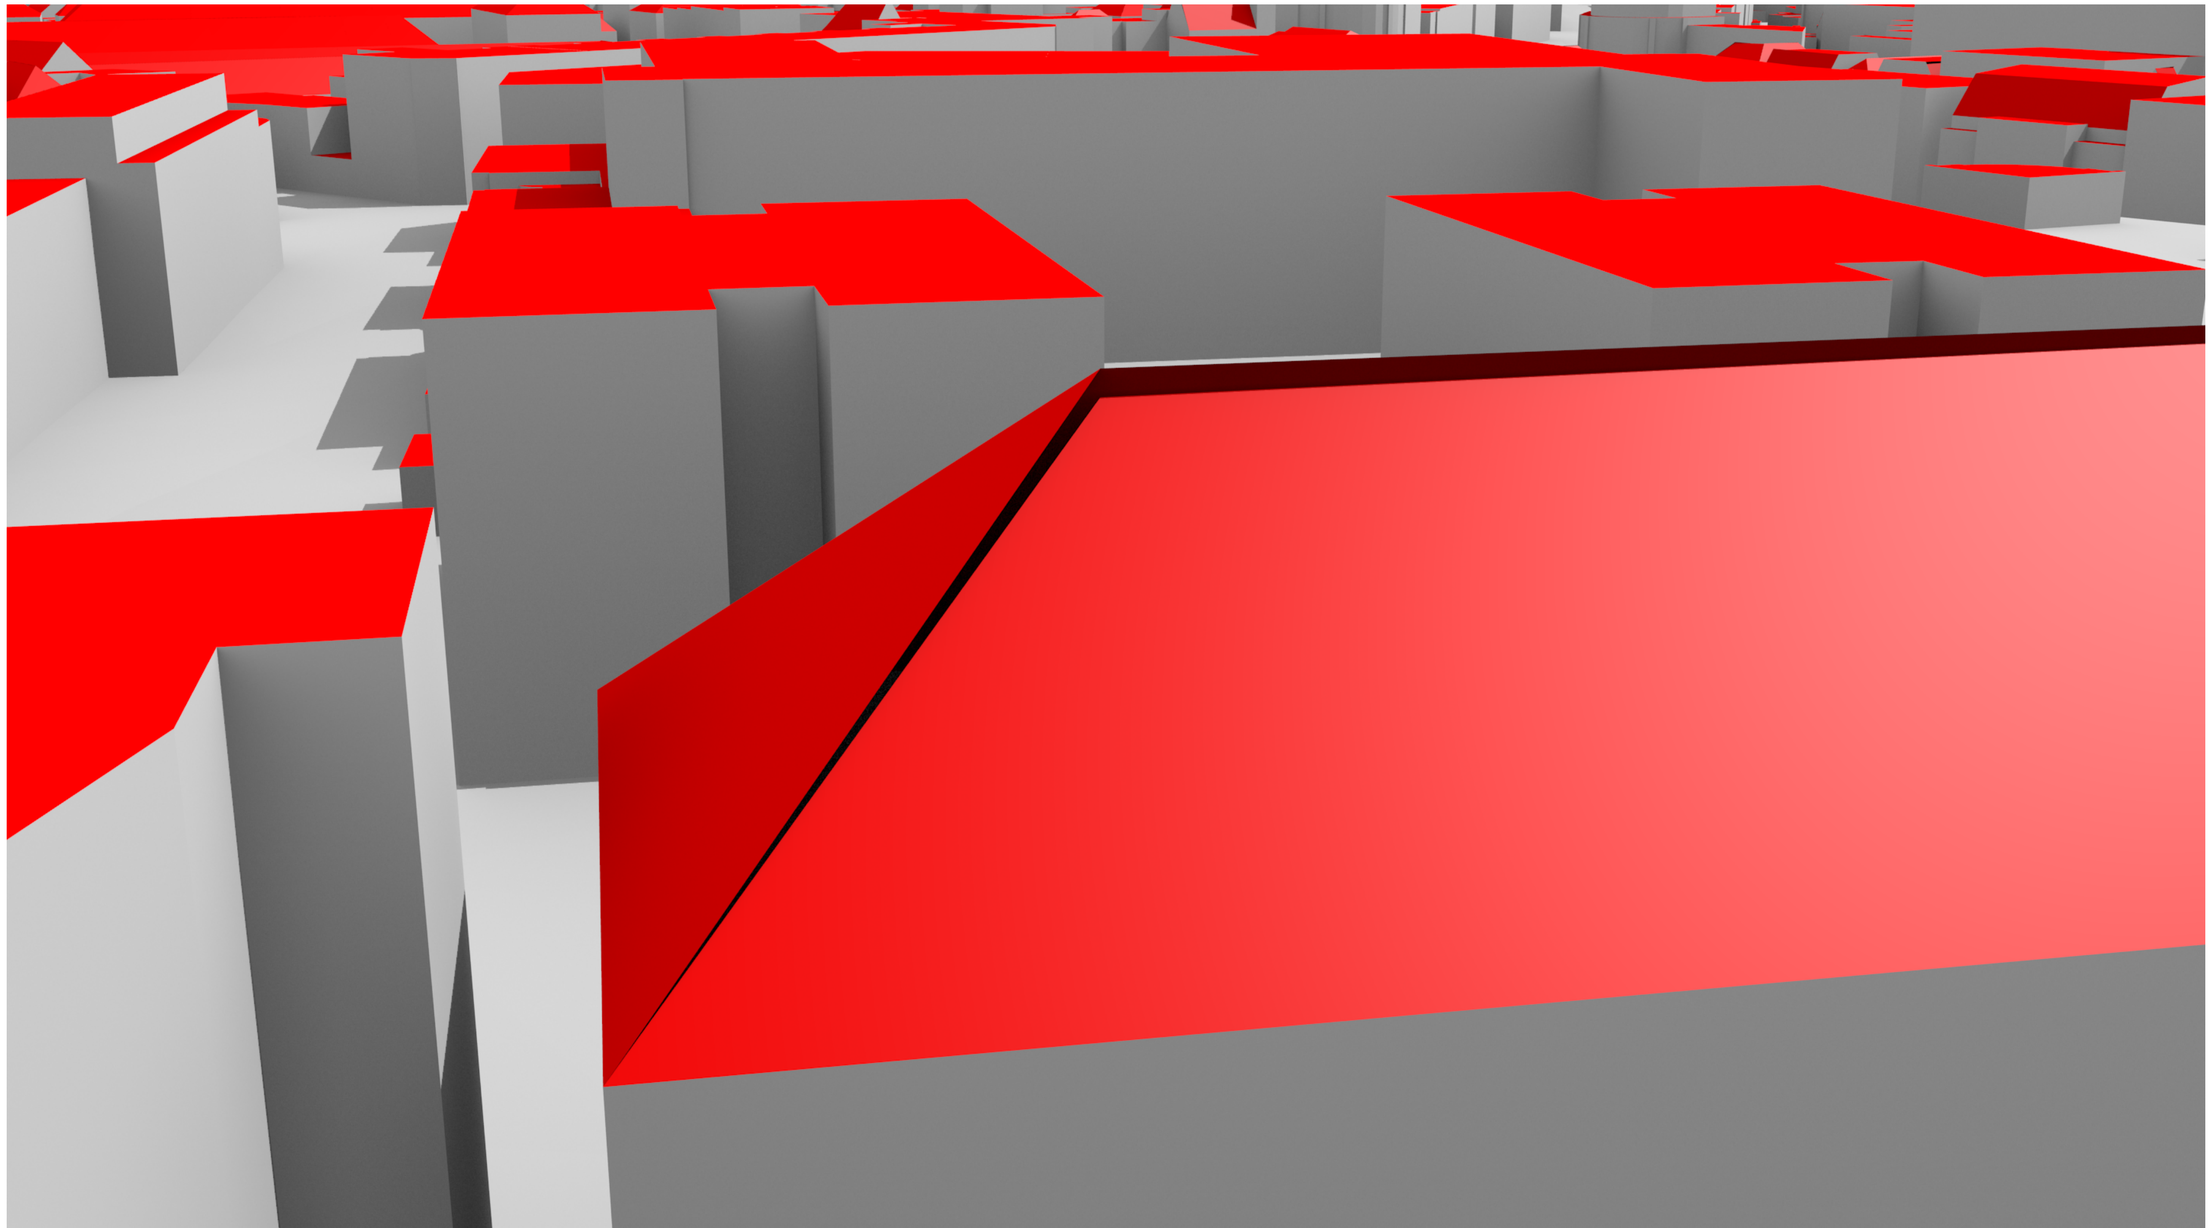
Solar potential — wrong orientation == no potential assigned



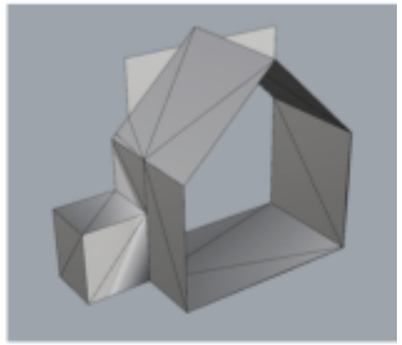
Volume calculation — tiny problems == impossible to calculate

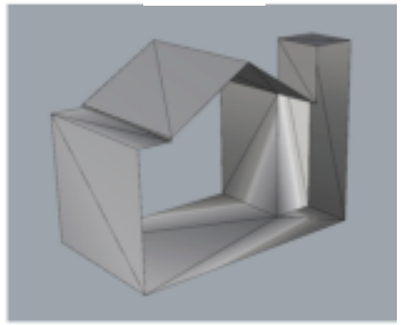


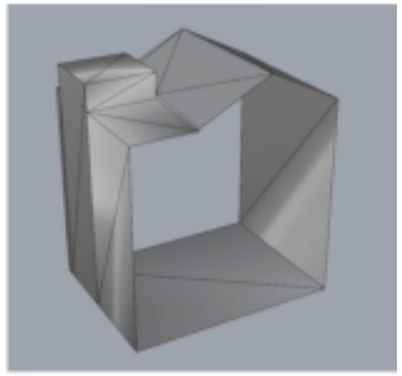
Volume calculation — tiny problems == impossible to calculate

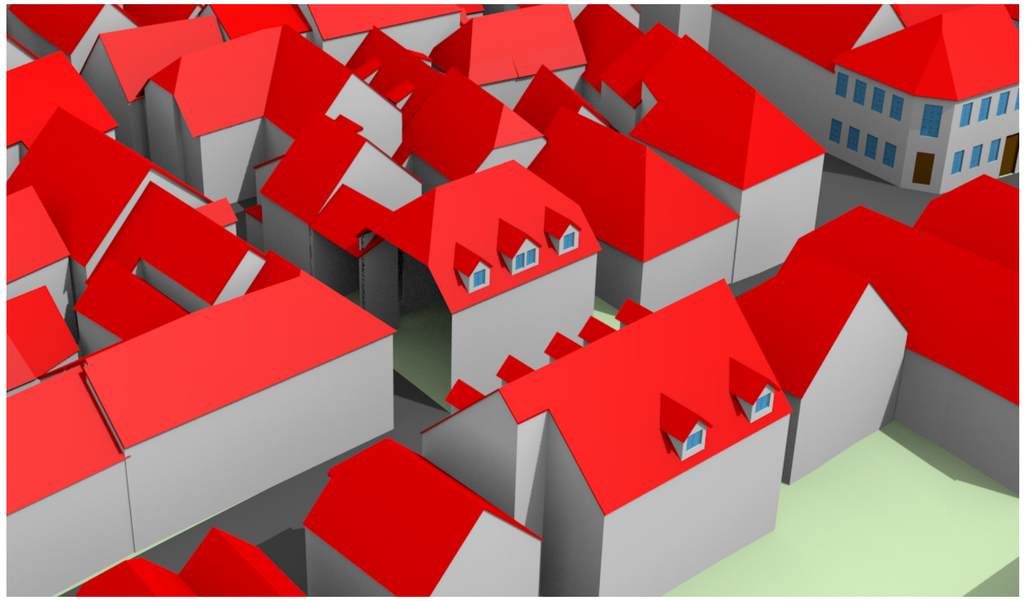


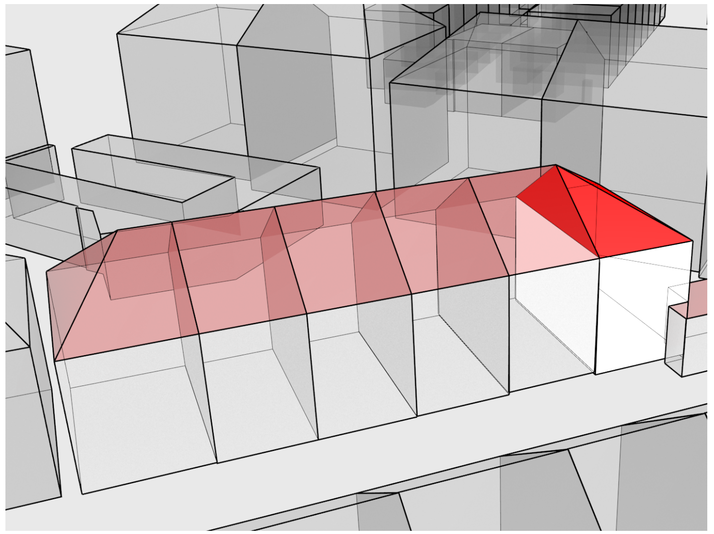
Volume calculation — big problems == also impossible to calculate...



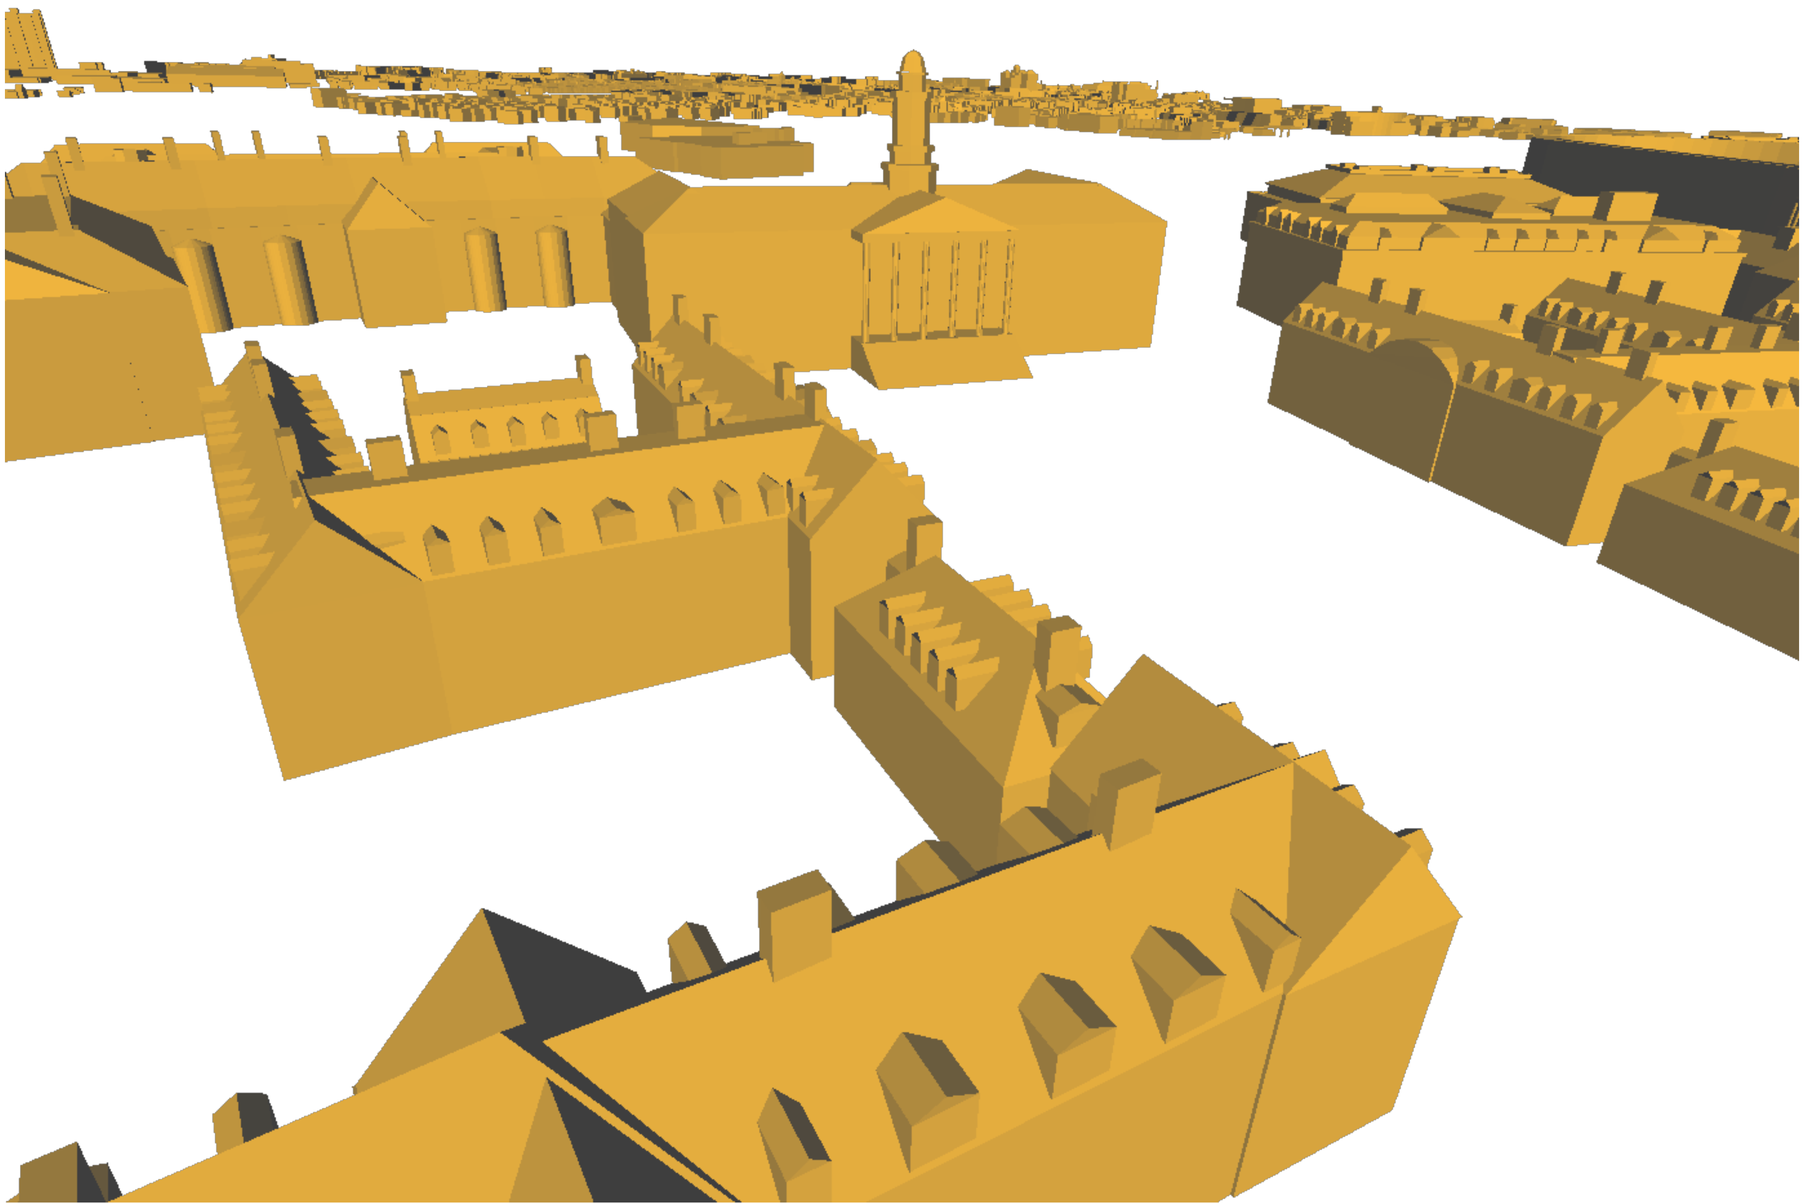




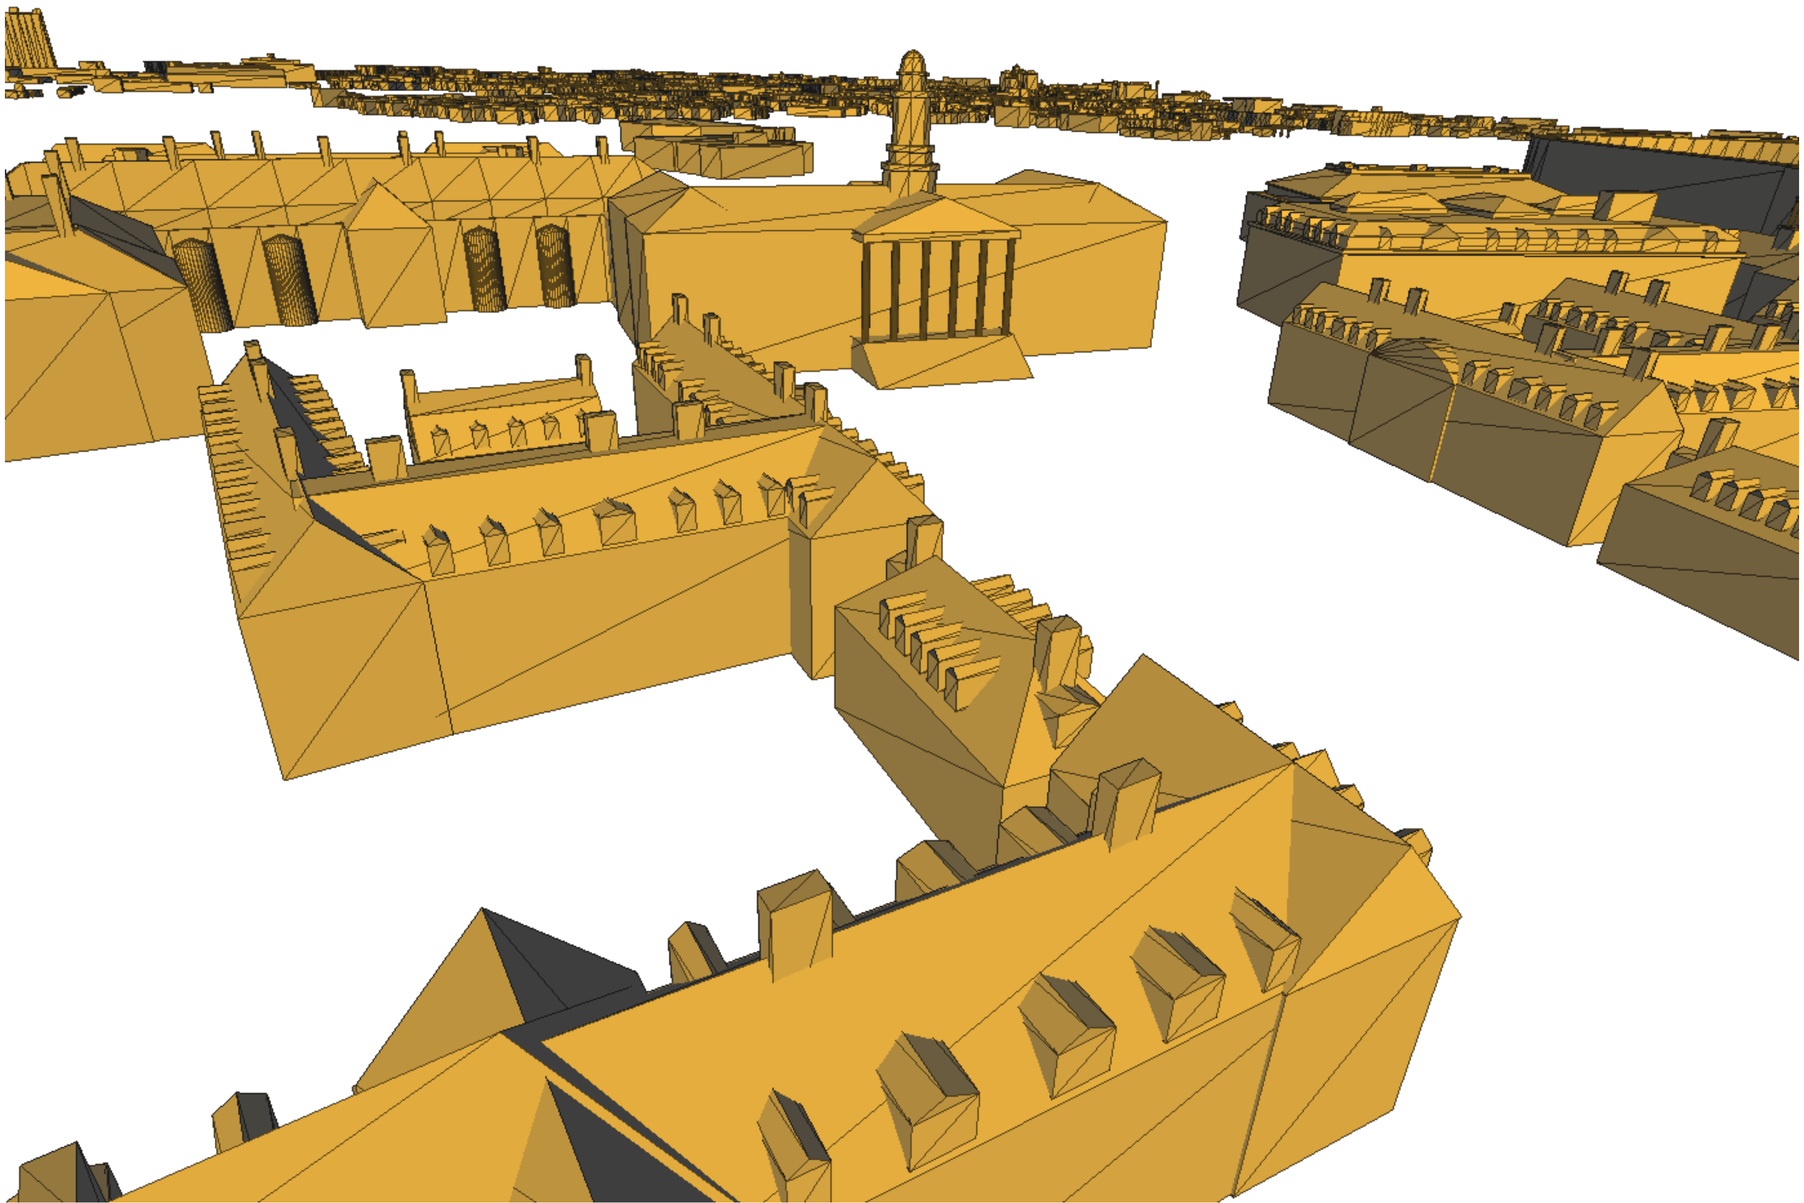




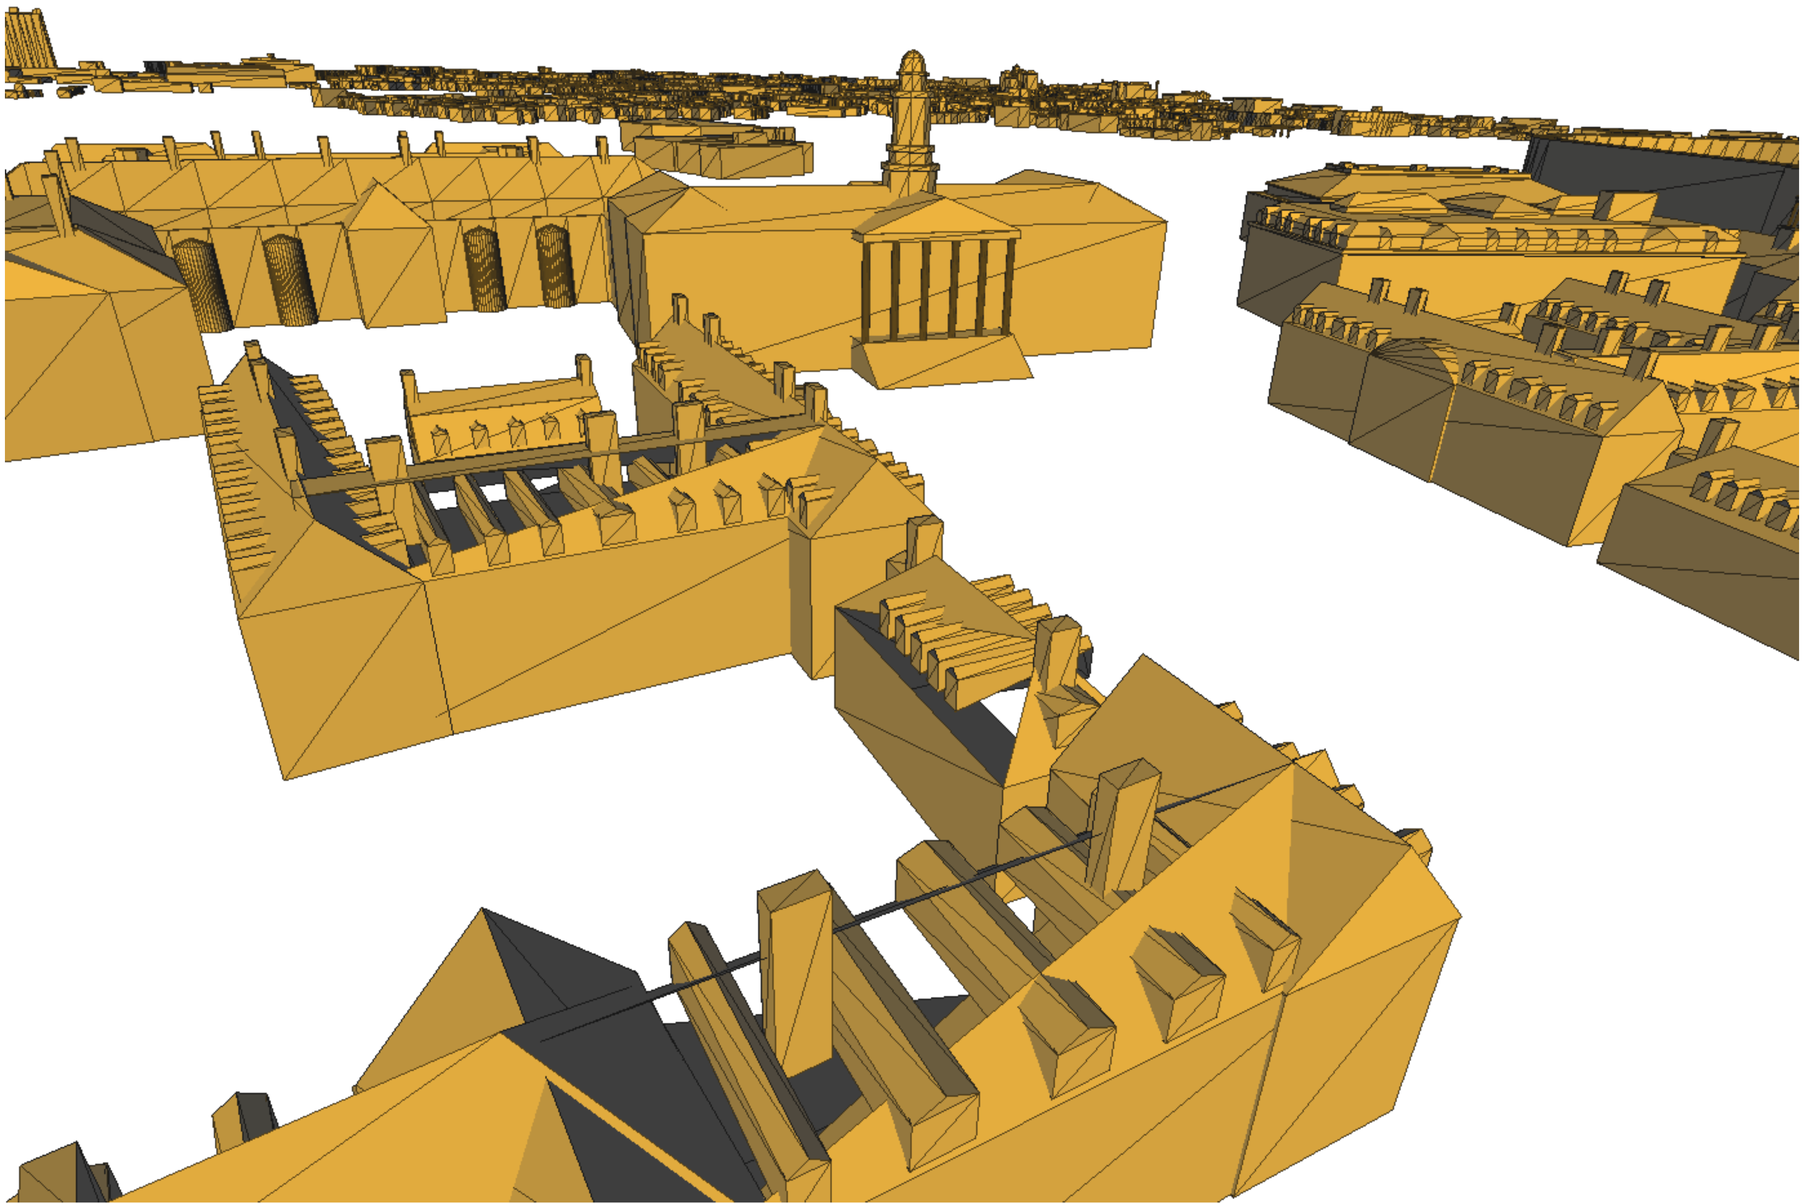
Volume calculation — superstructures not topologically connected



Volume calculation — superstructures not topologically connected



Volume calculation — superstructures not topologically connected



Advanced simulations — wind comfort for pedestrians

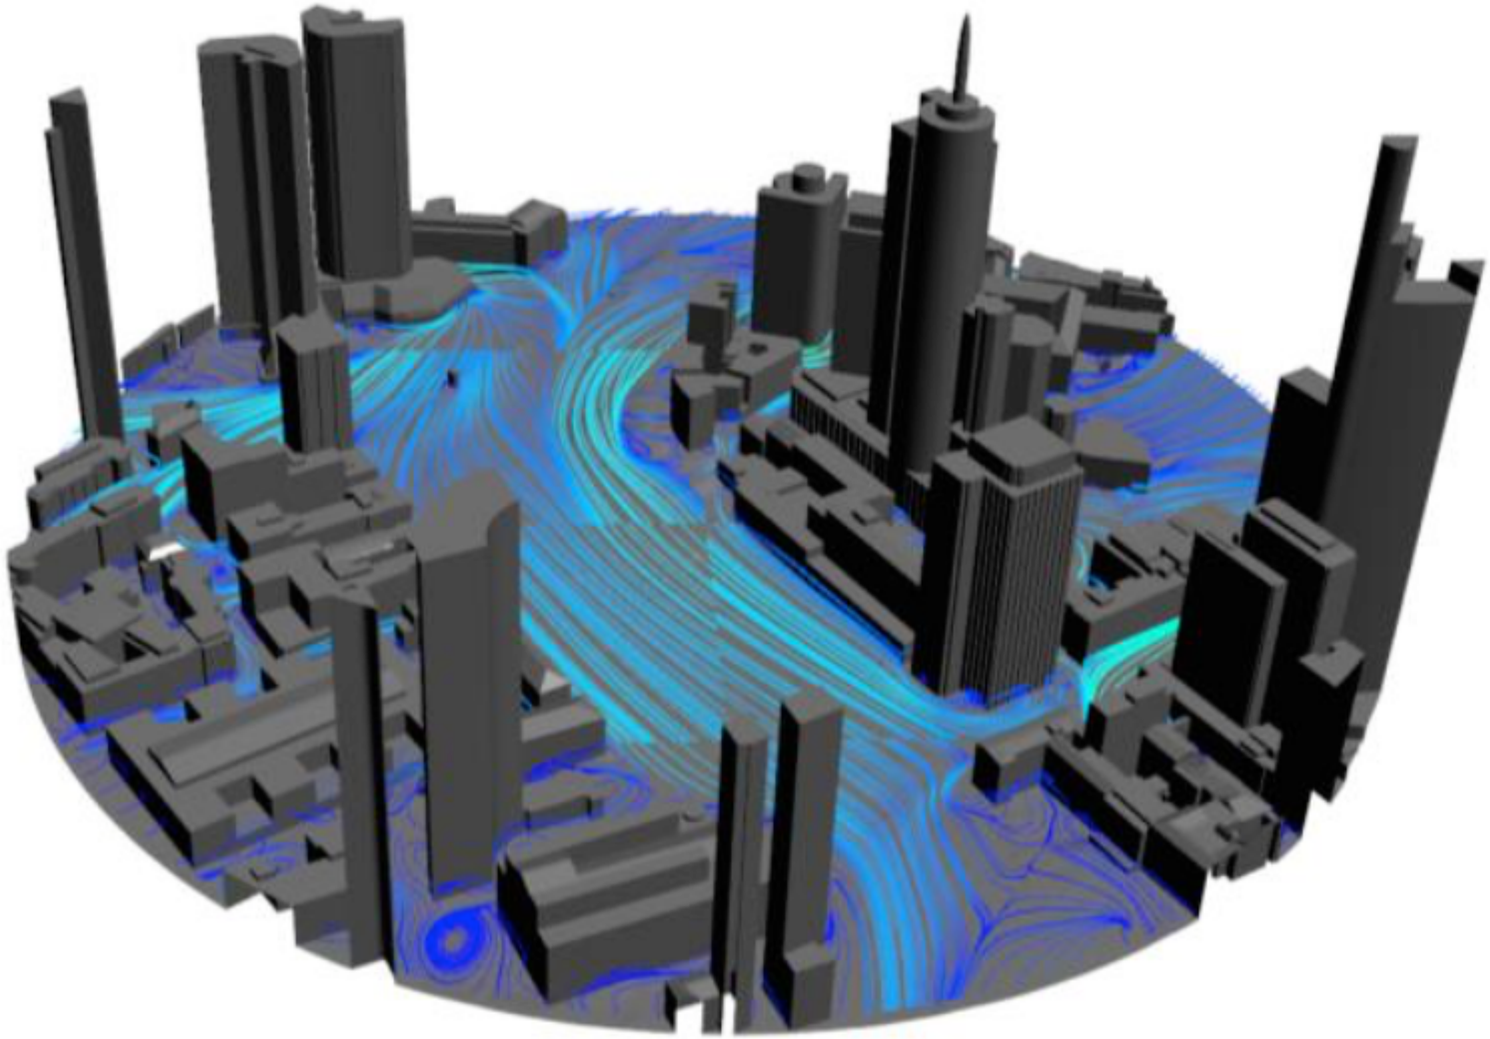


Figure from CADFEM.de

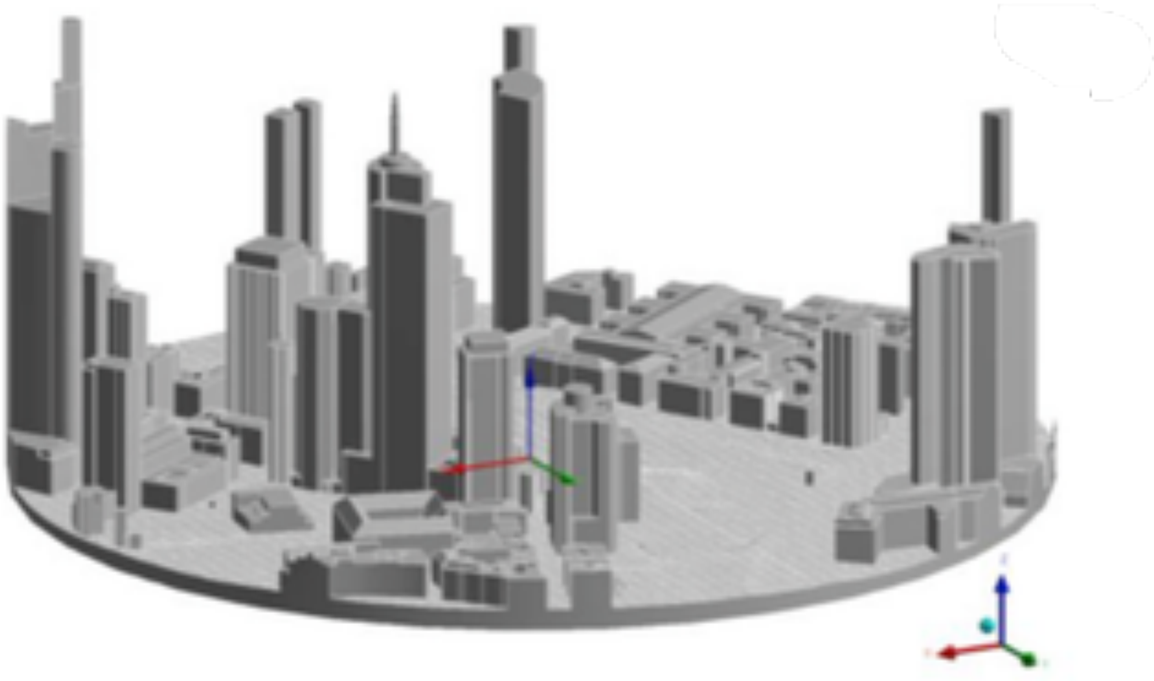
Advanced simulations — CFDmethods: subdivision of volume

computational fluid dynamics



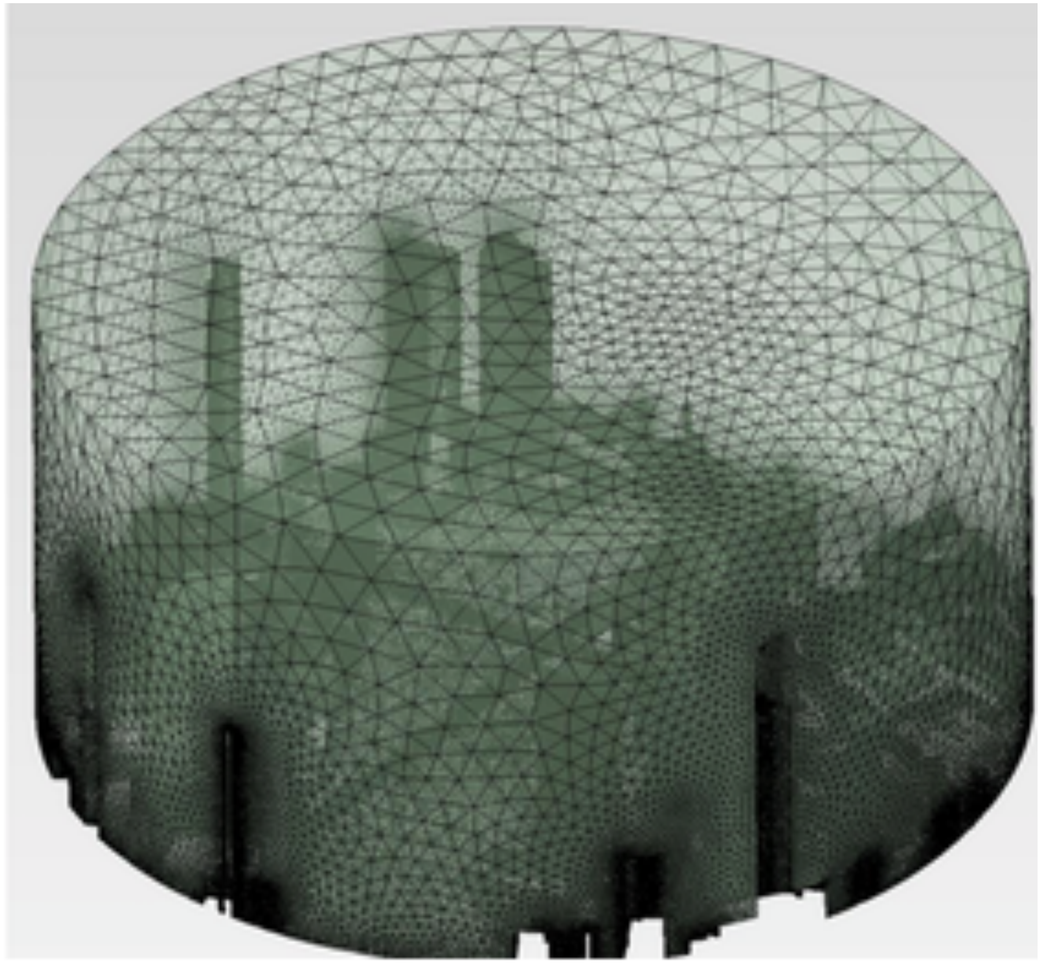


Figure from CADFEM.de

Advanced simulations — very strict input requirements

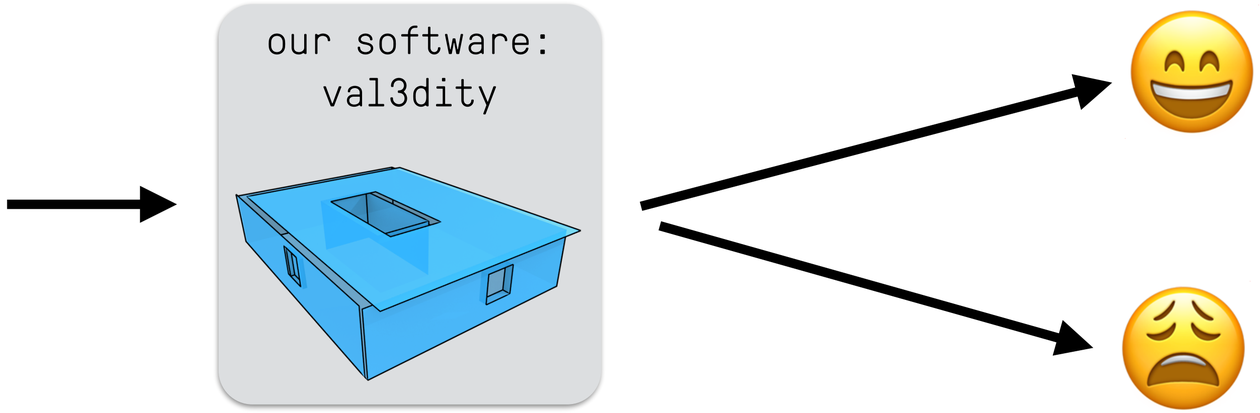
- no holes
- no intersections
- triangles must have certain shape (no *slivers*)
- a “perfect” model is thus required
- in practice, that still means several hours of (semi-)manual repair

Figure from CADFEM.de

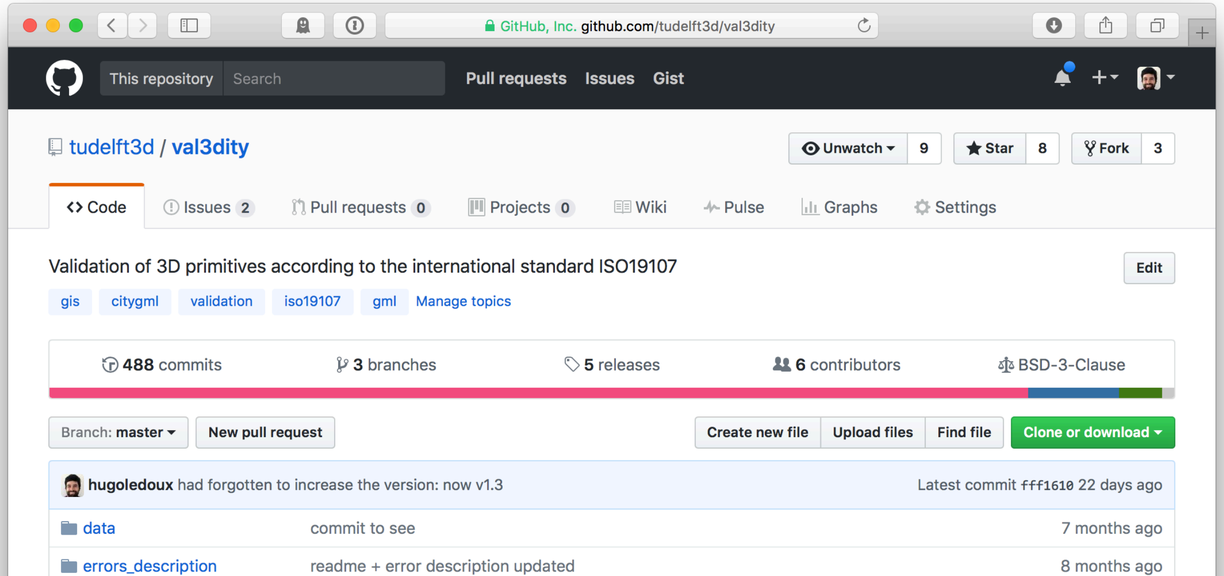
Our methodology

37 CityGML datasets from 9 countries

40 million polygons in 3.6 million buildings (Solids + MultiSurfaces)

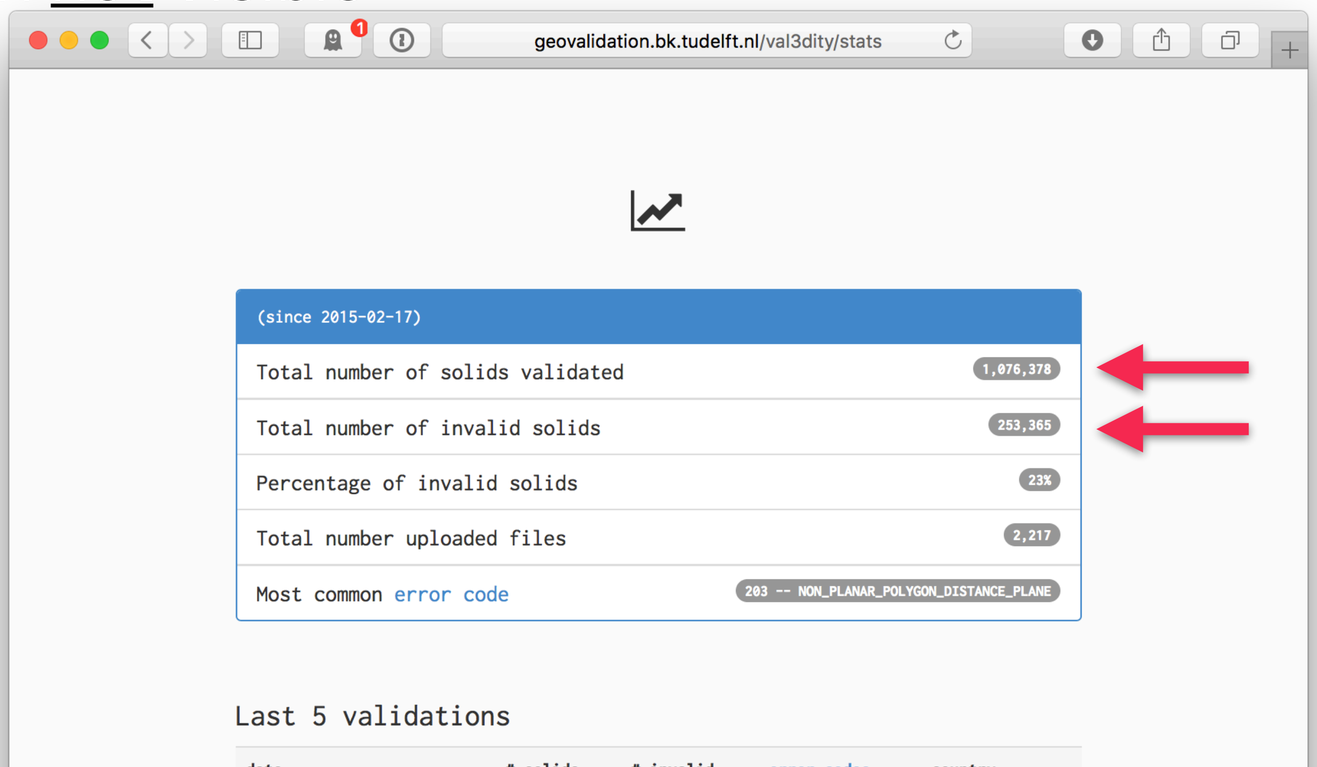


- 37 CityGML datasets from 9 countries
- 40 million polygons in 3.6 million buildings



Summary of results

- No CityGML dataset is 100% valid, not even LoD1 😩
- Many simple errors, eg:
  - repeated vertices
  - non-planar polygons (most common error!)
- Notice that these are often not visible



Summary of results

KEY WORDS: CityGML, 3D city models, Quality control, Validation, Error

ABSTRACT:

To be used as input in most simulation and modelling software, 3D city models should be geometrically and topologically valid, and semantically rich. We investigate in this paper what is the quality of currently available CityGML datasets, i.e. we validate the geometry/topology of the 3D primitives (`Solid` and `MultiSurface`), and we validate whether the semantics of the boundary surfaces of buildings is correct or not. We have analysed all the CityGML datasets we could find, both from portals of cities and on different websites, plus a few that were made available to us. We have thus validated 40M surfaces in 16M 3D primitives and 3.6M buildings found in 37 CityGML datasets originating from 9 countries, and produced by several companies with diverse software and acquisition techniques. The results indicate that CityGML datasets without errors are rare, and those that are nearly valid are mostly simple LOD1 models. We report on the most common errors we have found, and analyse them. One main observation is that many of these errors could be automatically fixed or prevented with simple modifications to the modelling software. Our principal aim is to highlight the most common errors so that these are not repeated in the future. We hope that our paper and the open-source software we have developed will help raise awareness for data quality among data providers and 3D GIS software producers.

1. INTRODUCTION

In recent years, several cities around the world have released their

Related work considers additional aspects, e.g. resolvability of `XLinks`; application-specific rules, such as that a building is required to have a ground floor to form a volume (which is, surprisingly, not mandatory in CityGML); and the redundancy of the

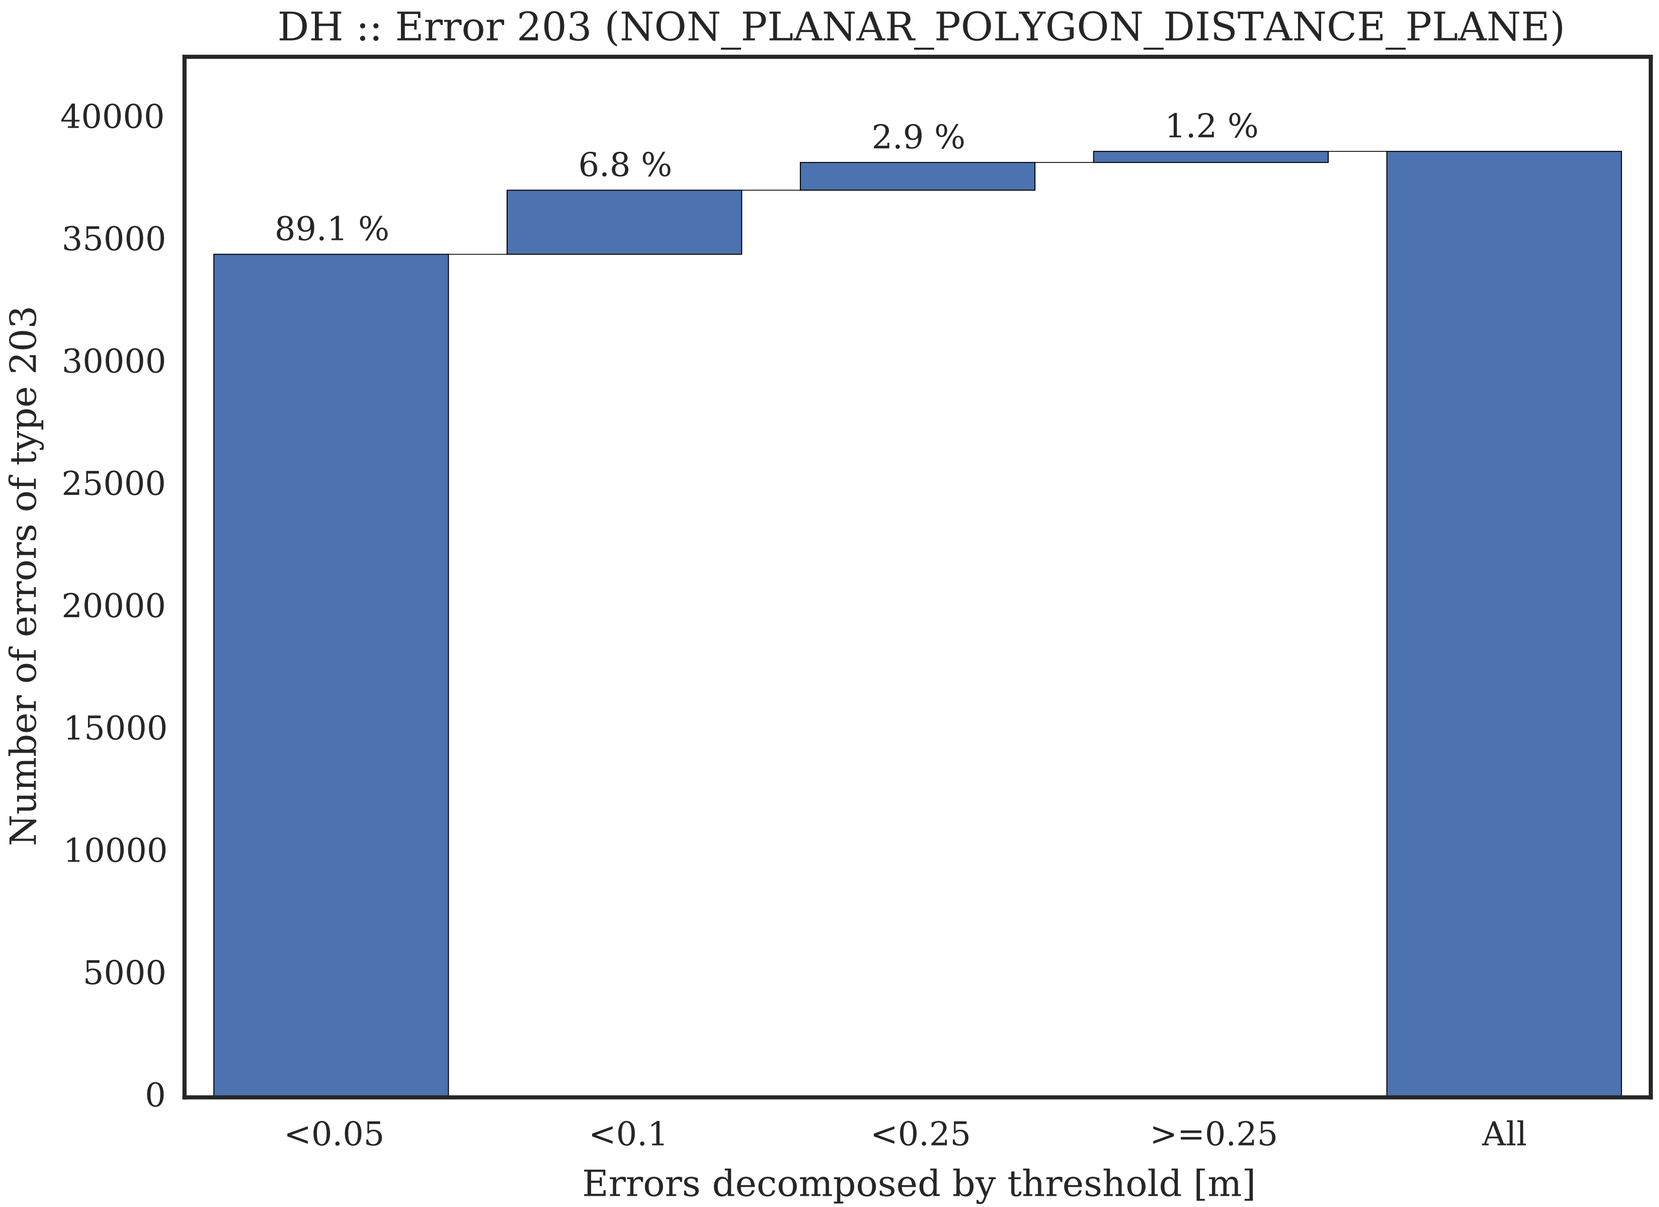
some datasets couldn't be read

high % of invalid

Most common error: non-planar surface



About GIS standards

Standardisation organisations

- **ISO**: International Standardisation Organisation
- **OGC**: Open Geospatial Consortium
- **INSPIRE**: **In**frastructure for **S**patial **I**nfo**r**mation in **E**urope
- **NEN**: *normalisatie en normen* (“Dutch ISO”)

ISO 191xx series of geographic information standards

- A main goal of the ISO 191xx series is to facilitate the interoperability of geographic information systems, i.e. ability to discover, access, understand and use the information and tools, independently from the platform supporting them
- Structured set of standards specifying methods, tools and services for the management of geographic information, including:
  - Definition of data,
  - Access to data
  - Presentation of data
  - Transfer between users
- weirdly, and annoyingly, one has to pay to read these 😩

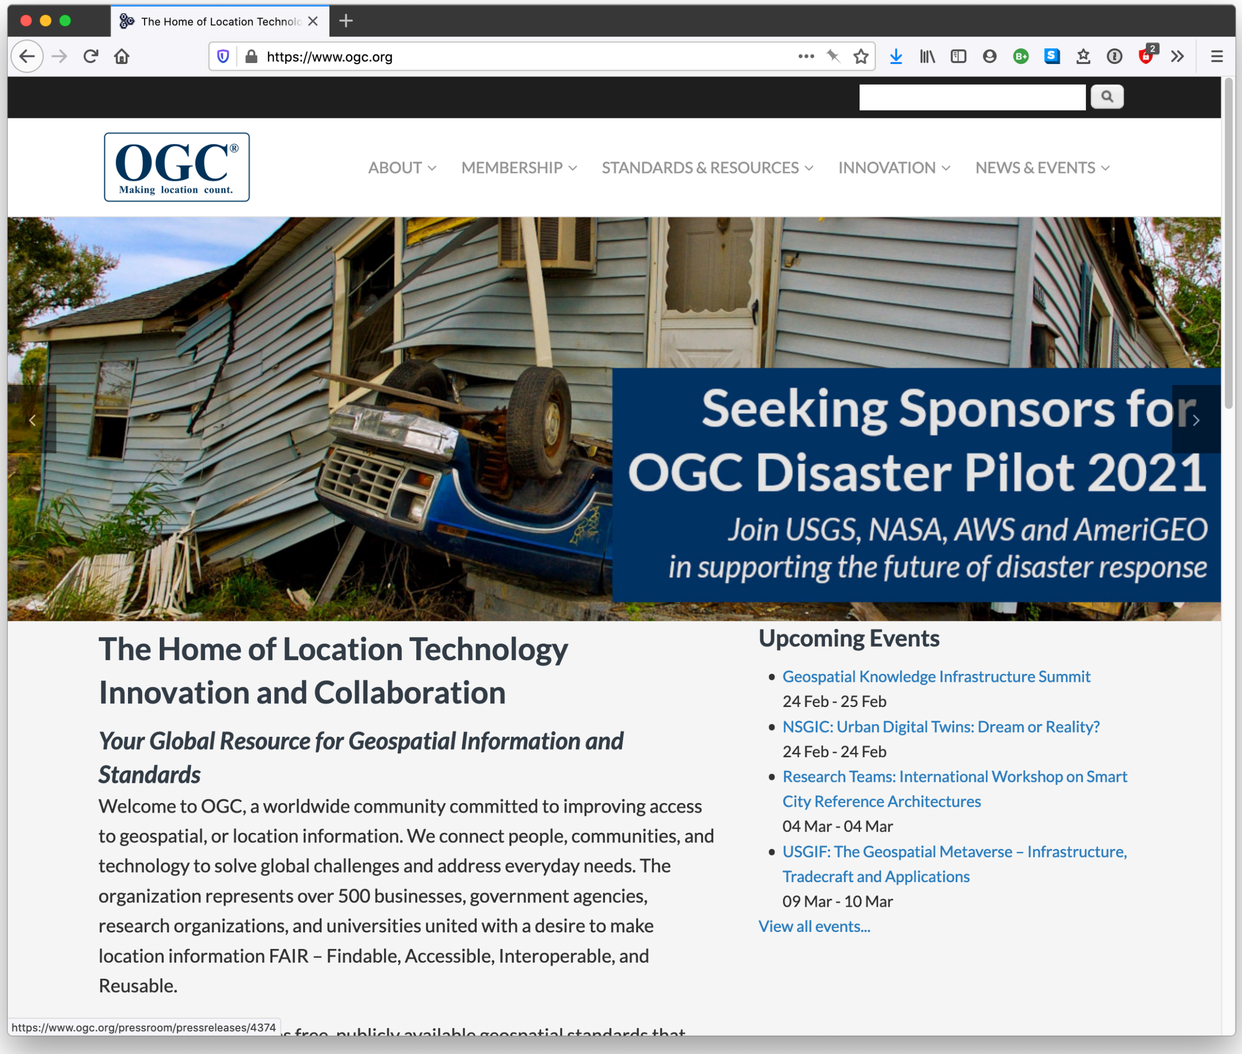
19119 - Services	19141 - Schema for moving features
19120 - Functional standards	
19121 - Imagery and gridded data	

OGC: Open Geospatial Consortium®



- many standards are aligned with ISO's (ie, they are exactly the same)
- OGC usually standards closer to implementations then ISO
  - GML
  - CityGML
  - KML
  - netCDF
- abstract specifications = ISO
- implementation specification = OGC
- unlike ISO's, OGC's documents are free 😊
