

High Resolution Solar Potential Map for TU Delft Campus and Real Estate

Yilong Zhou

22nd of January 2021
Delft, the Netherlands

Main Objectives

Provide a map which visualizes the **sunlight and DC yield potential** on TU Delft campus

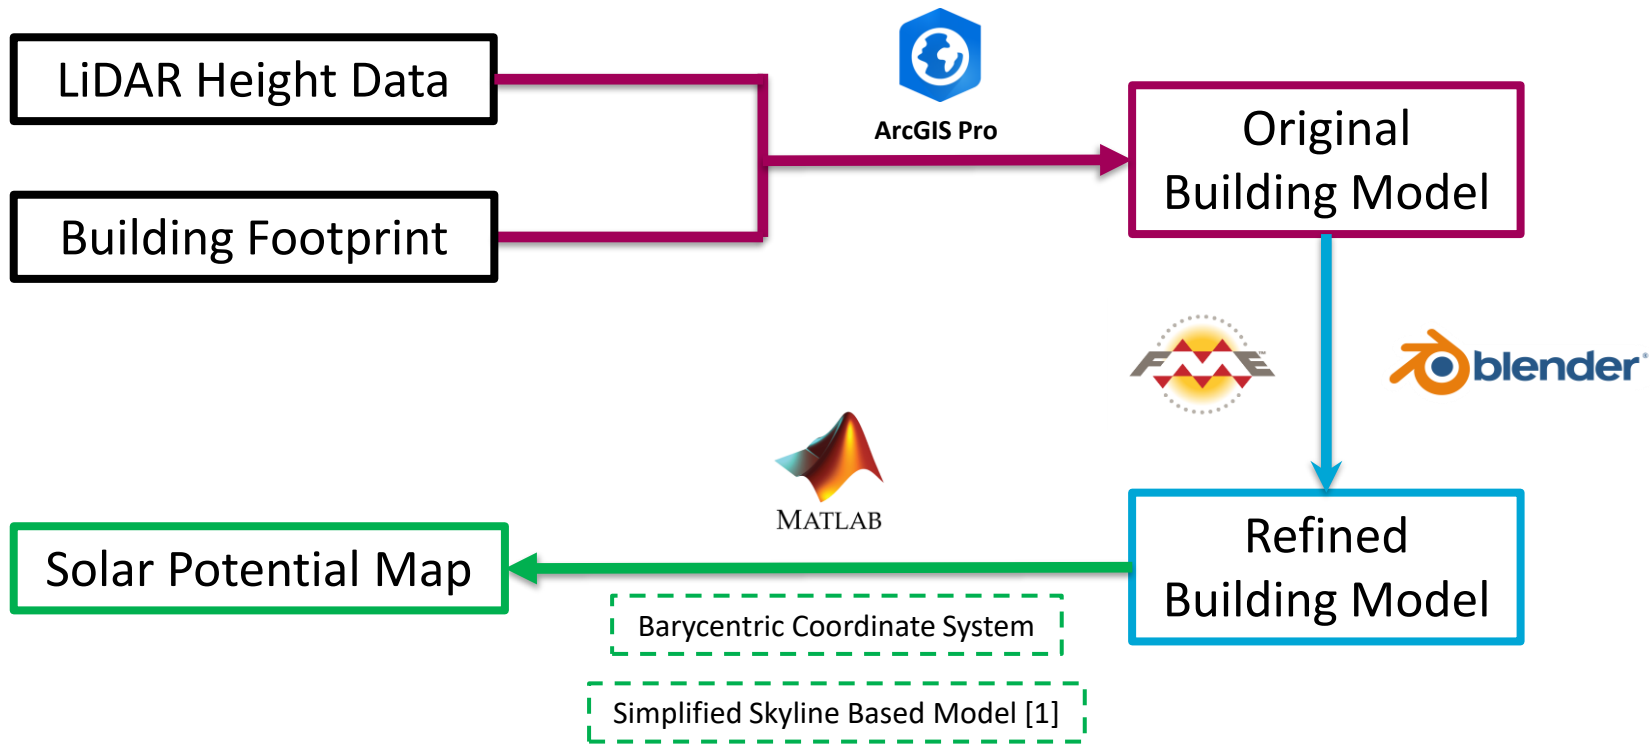

Serve for advisory and consulting purpose to **prioritize buildings for PV installation**

Research Questions

- How do we reconstruct the 3D building models on TUD Campus?
- How do we calculate the solar potential on building roofs and facades?

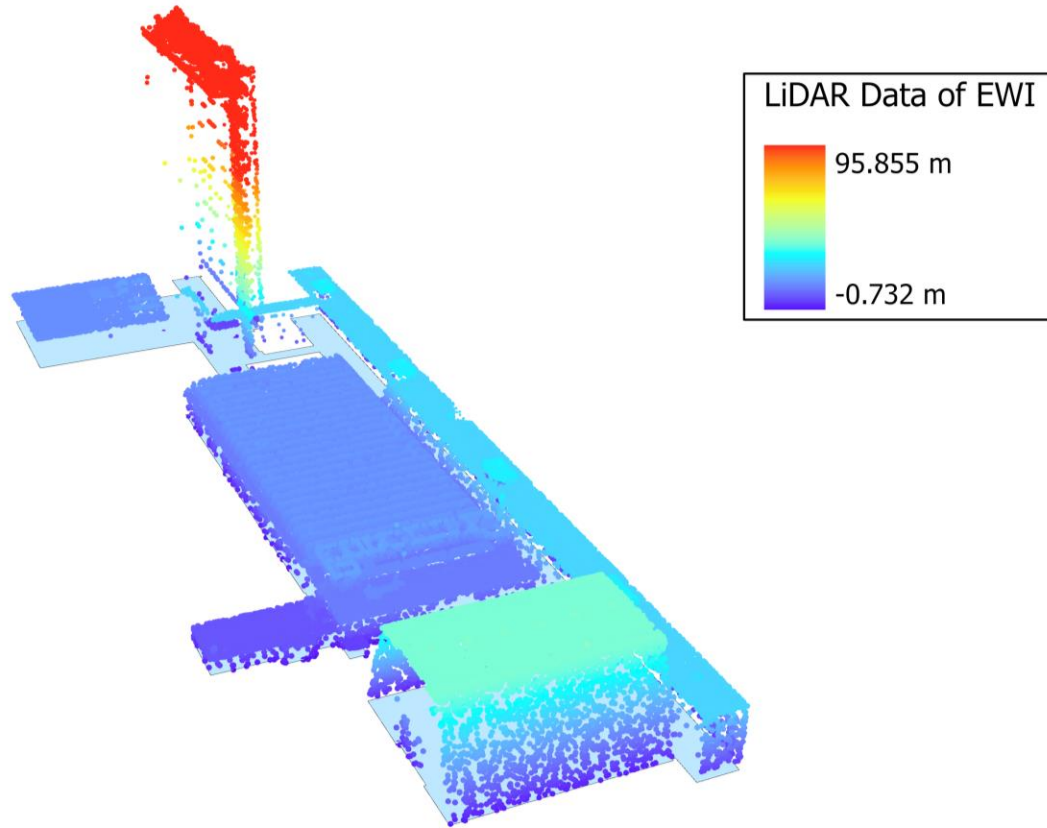

Solar Potential Calculation Workflow

3D Building Model Reconstruction

- **Barycentric Coordinate System**

A coordinate system

in which the location of any point within a triangle can be expressed as

$$P = \alpha A + \beta B + \gamma C$$

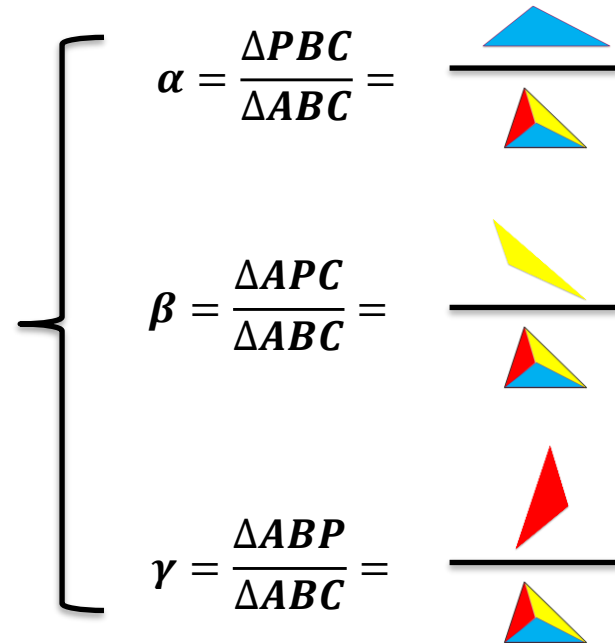

where

$$\left\{ \begin{array}{l} \alpha, \beta, \gamma \in [0, 1] \\ \alpha + \beta + \gamma = 1 \end{array} \right.$$

Campus North

Campus East

Conclusions

- 3D Building model can be reconstructed from LiDAR data and building footprint
 - Input data are **freely available and reliable**
 - Reconstructed 3D model is fairly accurate **with ± 5 cm deviation**
 - Process is **not fully automated** and requires some manual work
- Using Barycentric Coordinate System can uniformly generate grid for solar potential analysis
 - **User-defined** grid density
 - **Works successfully with simplified skyline-based model** to calculate solar potential on building roofs and facades

Thank you for your attention!
