Part 1: Fake It Till You Make It

Standard Flow Configuration

How to best populate the grid cell values, to reach the final state “as quickly as possible”?

Target Final State to Achieve

But why do we care about this?

Computational Cost $\sim N_x \times N_y \times N_z$

Cost is estimated using: $N_{CPU} \times T$ (hours)

Reference	Flow	Re	Hours	Core type	Cores	Model	Memory (GB)
6. Mansour ³⁴	Channel	595	185	CPU	64	IBM SP2	4.096
7. Kim ⁶	Channel	180	62.5	CPU	4	Cray-XMP	56 Mb
8. Jiménez ⁷	Channel	2003	2929.69	CPU	2048	PowerPC 970FX	4096
10. Lee ^{9,10}	Channel	5186	381.47	CPU	524288	PowerPC A2	512 TB

Lots of CO2 output for no reason! We better find a fast way to spin up to the final state.

Standard Flow Configuration

Target Final State to Achieve

Use an existing tool – differently! – No Math Version

Instead of using the synthetic turbulence generator as an inflow, populate the grid with data!

Use an existing tool – differently! – No Math Version

Instead of using the synthetic turbulence generator as an inflow, populate the grid with data!

Choose a sensible velocity

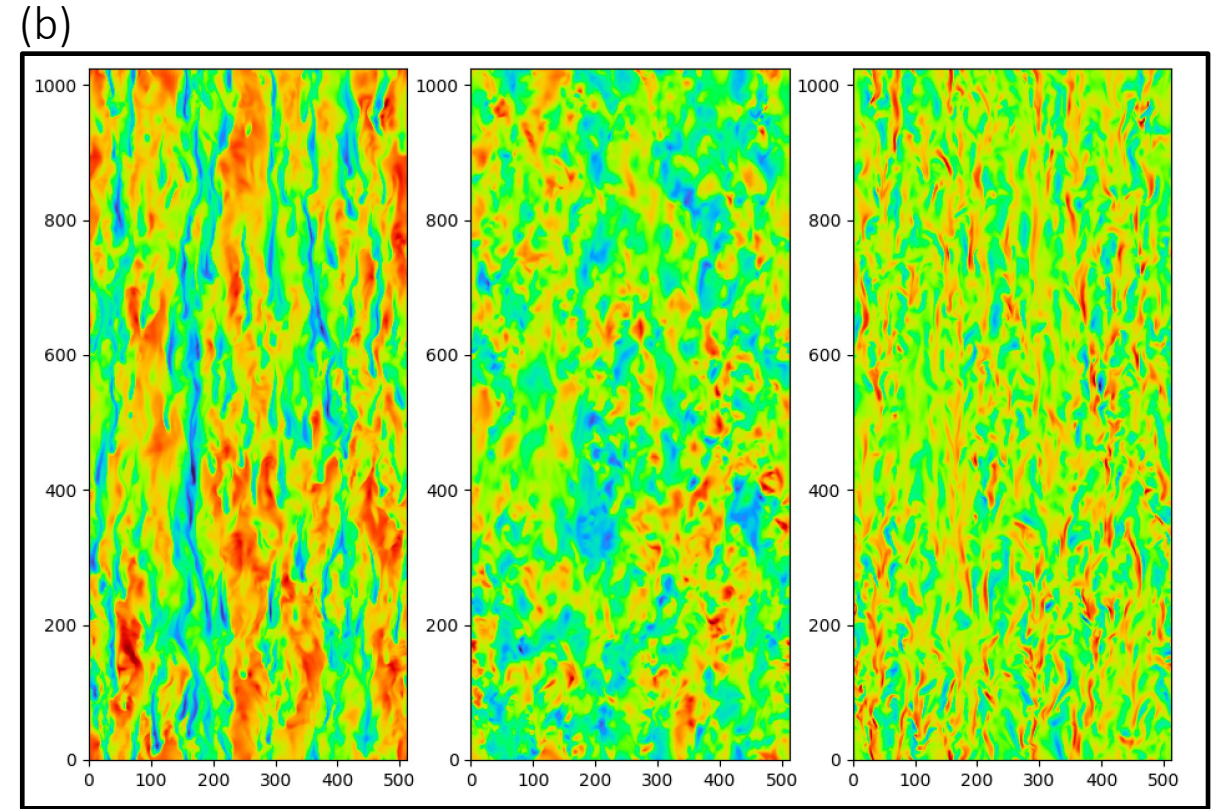

$$\Delta t_{\text{STFG}} = \frac{\text{CFL} \Delta x_1}{U_c},$$

Vertically averaged bulk velocity

Can you guess which one is fake and which one is real?

BreatheLab affiliates are NOT allowed to answer/respond!

Let's test how good is this fake turbulence

Using artificial turbulence to achieve swift
converged turbulence statistics in a pressure-
driven channel flow

A. Patil and C. García-Sánchez

Supplementary Video 2

Comparison of transition to turbulence,
friction Reynolds number: 500

A factor of 7-8 faster compared to conventional methods

End of Part 1

Part 2: GenSDF

But Why?

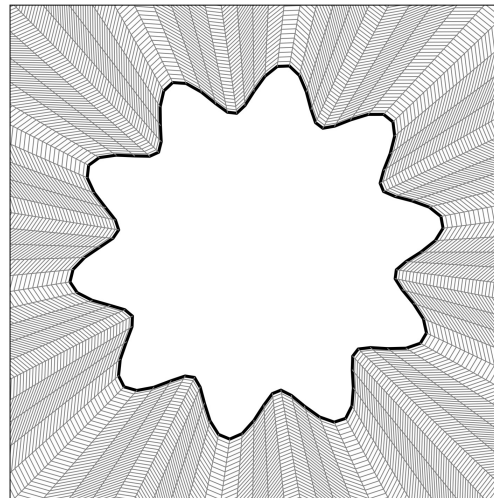

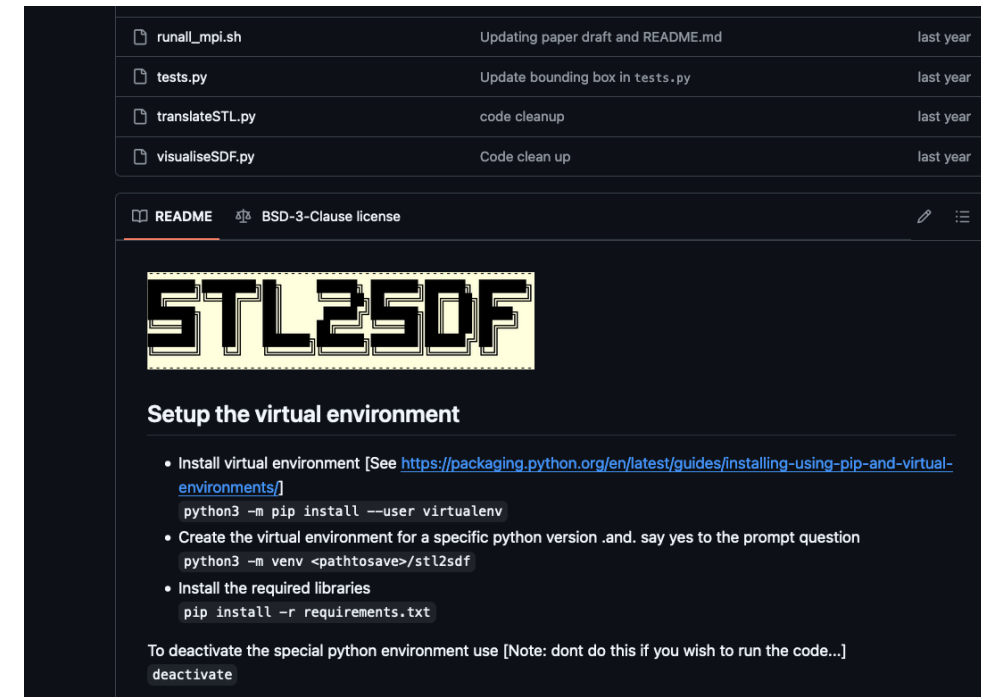

Memory hungry trimesh library
Slow python code and many more.....

Solution

Modern Fortran + MPI based implementation

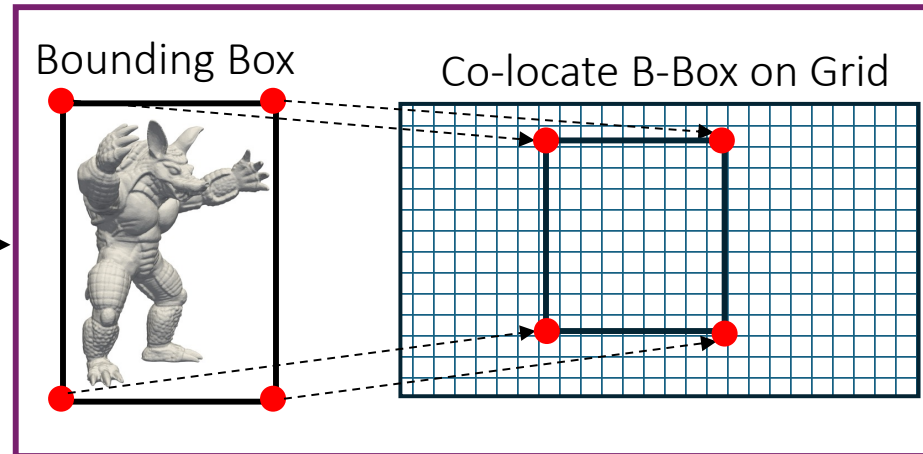

- Low memory requirements
- Easy to port to existing CFD solvers in Fortran
- Good excuse to program :)

STEP 1: Parsing Into Memory

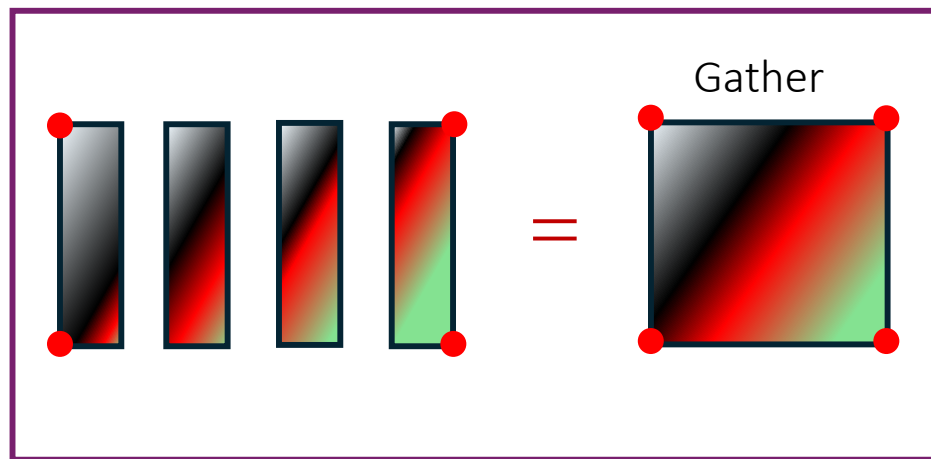

STEP 2: Tag B-Box on Grid

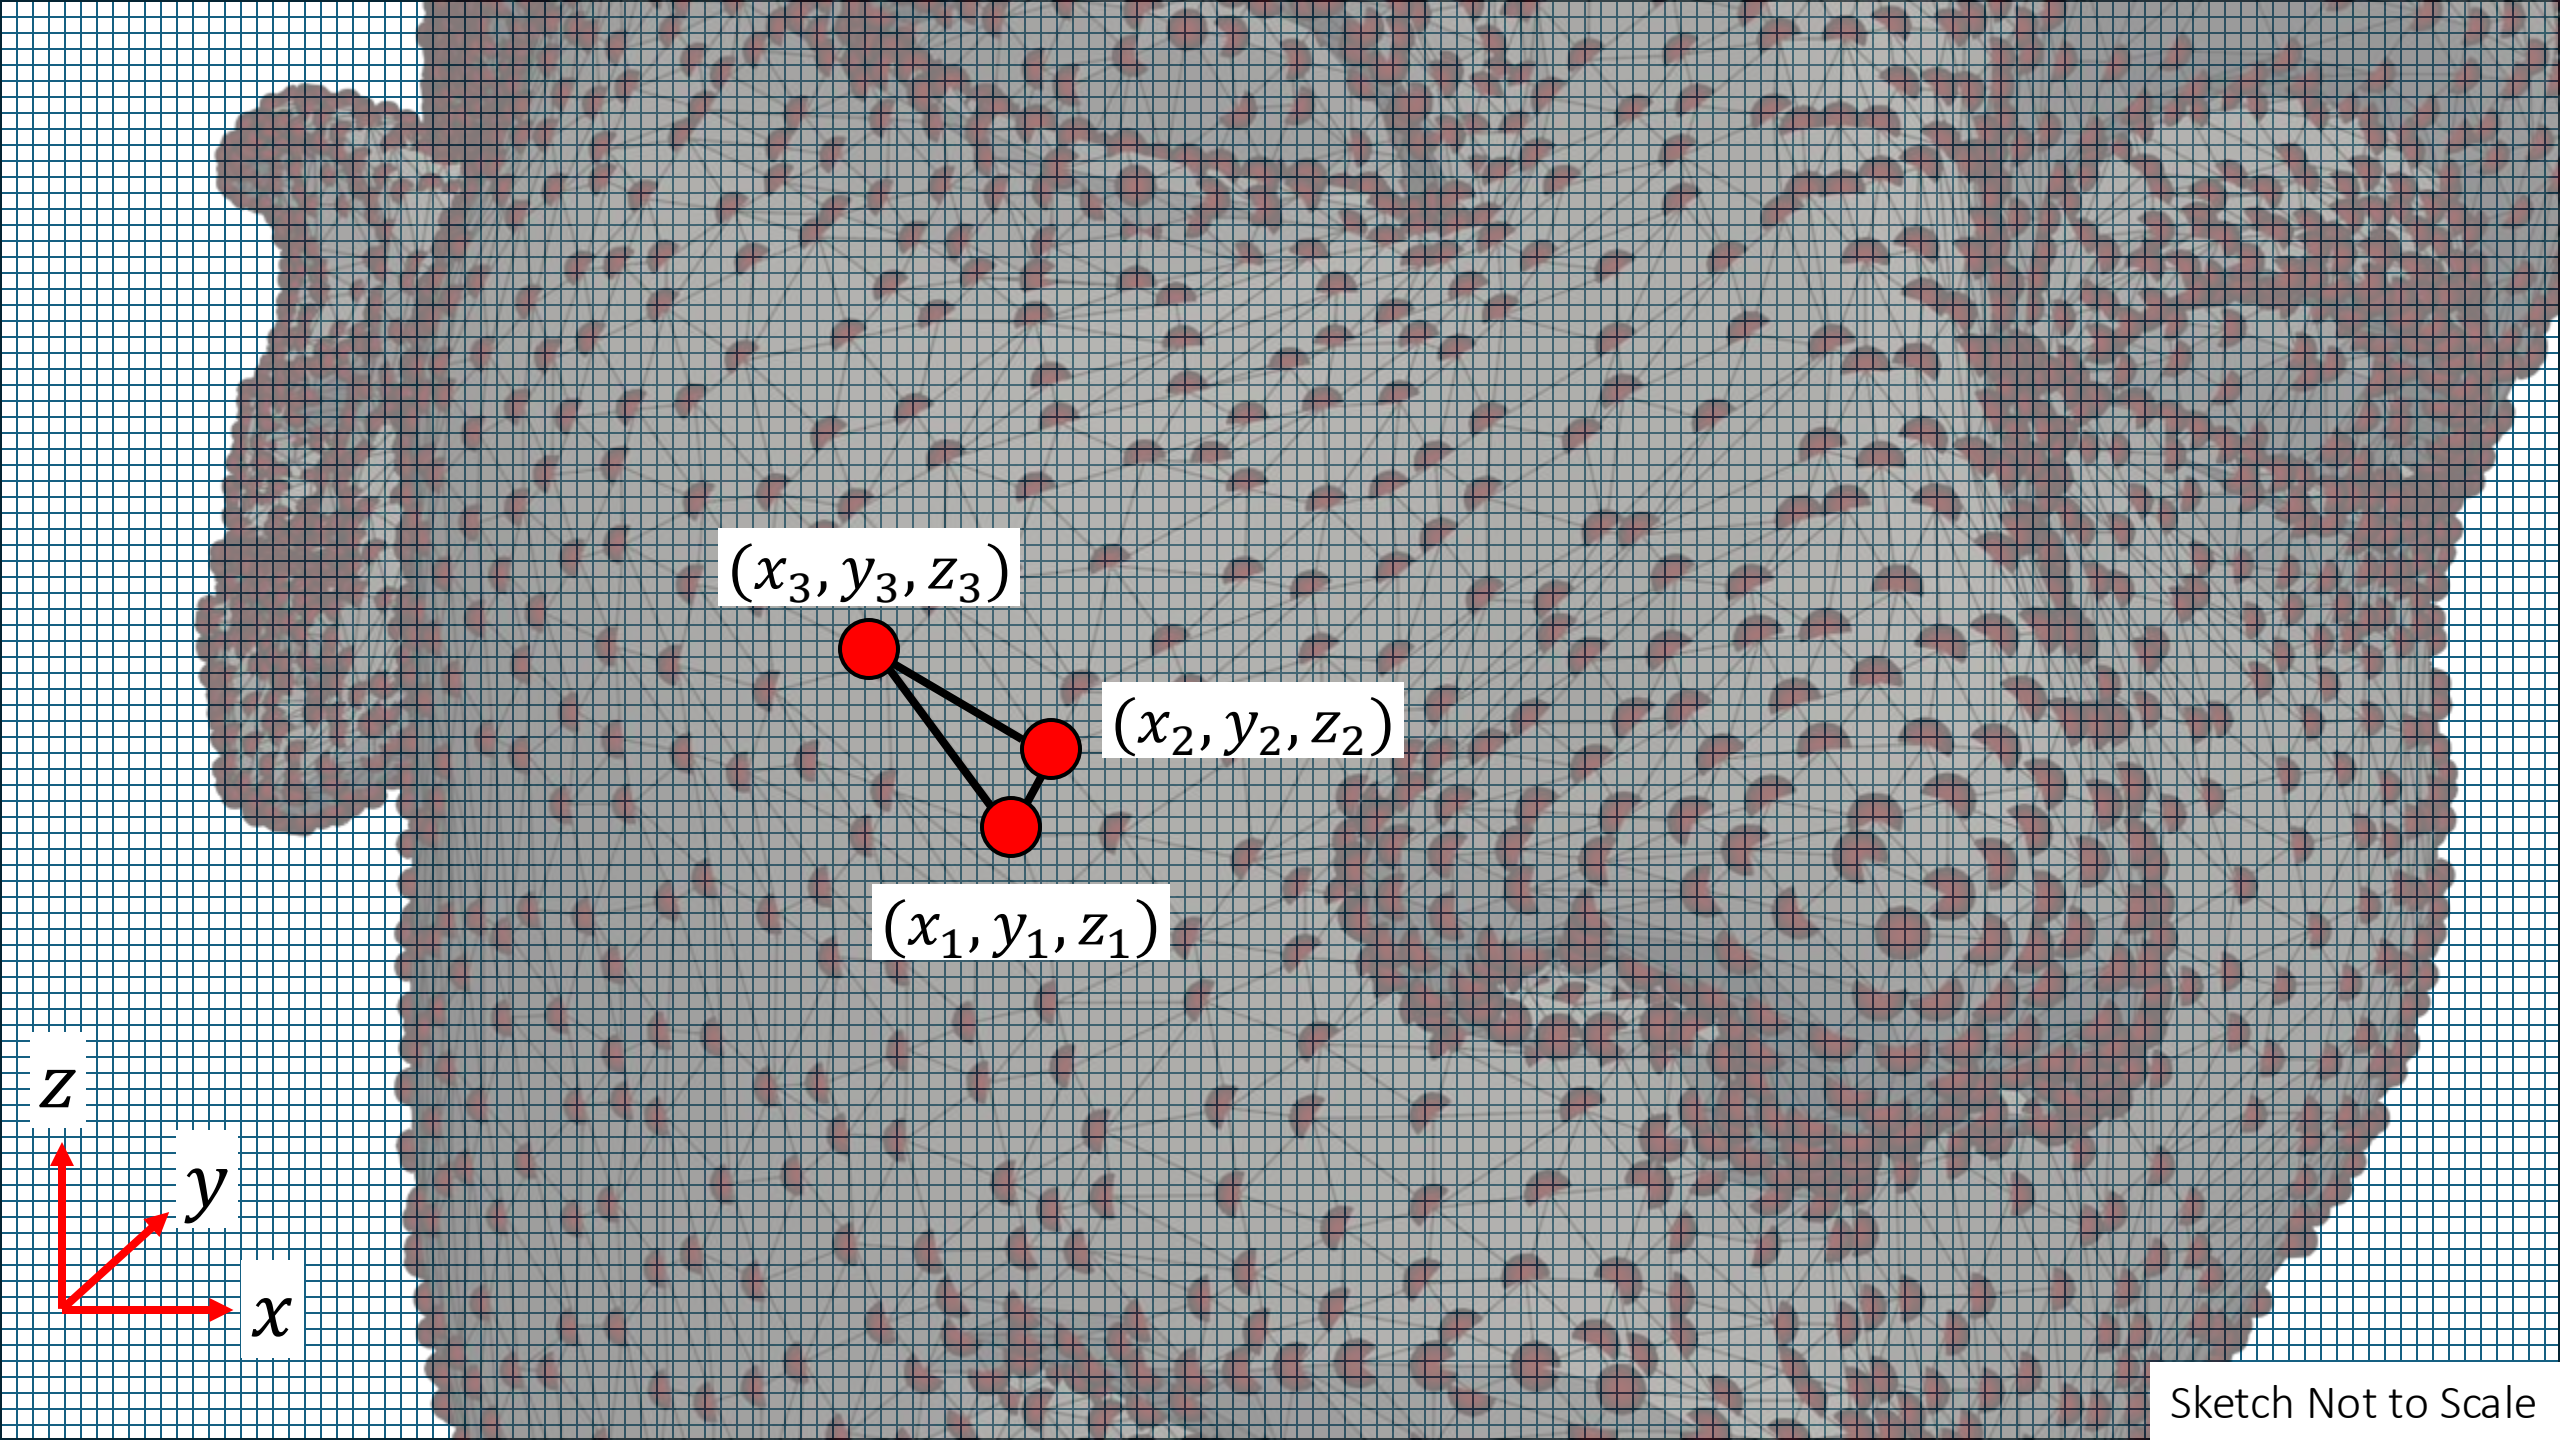

STEP 3: Decompose workload

STEP 4: Compute SDF

Sketch Not to Scale
